DICTIONARY DEPARTMENT

The New American
Encyclopedic Dictionary

EXPLANATORY.

In this work each WORD in the vocabulary is first given in its current form of spelling and pronunciation, and then are given the various forms of orthography which the word has successively assumed from its first appearance in the language, those forms which have become obsolete being marked with an asterisk (*).

The various GRAMMATICAL PARTS OF SPEECH in which a word occurs are grouped under one heading, with DEFINITIONS OF EACH PART, illustrated by QUOTATIONS, and each word is considered and defined with reference to every part of speech in which it can be properly used, and also with reference to the various meanings it has assumed during the growth of the language. Then follows a complete list of idiomatic and other PHRASES which have acquired a special meaning foreign to the individual significance of the words which compose them, all duly arranged under their proper parts of speech.

COMPOUND WORDS in which complete adhesion has taken place between the two or more constituents have been arranged as independent words; while those still so loosely united as to be usually connected by hyphens have been placed under the first word of the compound, and instead of being bunched under one heading, as in other dictionaries, are given in their regular alphabetical order in the vocabulary. This arrangement insures easy reference, prevents confusion of etymologies, and permits complete definitions. For example, after ELECTRO—seventy-nine compound words, beginning with ELECTRO-BALLISTIC and ending with ELECTRO-VOLTAIC, are given and defined before the word ELECTROCUTE occurs in the vocabulary. If it were not for this plan of having the compound words immediately follow the first word of their compound, the word ELECTROCUTE would appear just after ELECTRO-COPPER and just before ELECTRO-DEPOSIT.

THE PRONUNCIATION is indicated by diacritical marks, a key to which will be found at the foot of the several pages. The division into syllables has been made solely with reference to pronunciation, and with no reference to the etymology of the word. In syllables wherein two or more vowels come together, not forming diphthongs, only that one of them which gives its sound to the syllable bears a diacritical mark, the others being treated as mute. Thus, in brĕad, sĕa, flĕat, the *a* is mute, the syllables being pronounced as if spelled brĕd, sĕ, flĕt. Words of more than one syllable bear a mark upon the accented syllable, as âl'-tĕr.

THE ETYMOLOGY will be found enclosed within brackets immediately following each word. To understand the plan adopted, let it be noted (1) that retrogression is made from modern languages to ancient; and (2) that when after a word there appears such a derivation as this—"In Fr. . . Sp. . . Port. . . Ital. . . from Lat. . ." the meaning is, not that it passed through Italian, Portuguese, Spanish and French before reaching English, but that there are or have been analogous words in French, Spanish, Portuguese and Italian, all derived, like the English, from a Latin original.

PREFACE.

Origin of the Work

The material embodied in this *Dictionary* was prepared and arranged by an editorial staff of American scholars, assisted by a large number of specialists in their respective departments, eminent in the various branches of learning. The immense amount of labor involved in the undertaking was accomplished only by the combined efforts of all who took part in the construction of the work. The successful result is in a great measure due to the indefatigable labors of its editors, Edward T. Roe, LL. B., Le Roy Hooker, D. D., and Thomas W. Handford.

The publishers have spared neither labor nor expense in constructing a work which would fully meet the requirements of the times. Thousands of important new topics of interest to American readers have been carefully considered and prepared for insertion in the work, and the entire text has been rigidly and thoroughly revised, and brought down to the present time. These volumes form a practical work of reference, adapted to the use of all classes of people.

Additional help was given by thousands of persons, who furnished information on specific and technical subjects. Prominent representatives of the professions and trades, scientists, merchants, financiers, and members of various organizations, were unwearied in their efforts to assist in the preparation of the work. The editors were materially aided in their labors by a large force of proof-readers, who faithfully performed the duties which devolved upon them.

The editors adopted the plan of combining under one alphabet the features of both a dictionary and an encyclopædia. They selected as a basis the *Encyclopædic Dictionary* edited by Robert Hunter, A. M., LL.D., F. G. S., published in England in 1888. The task of collecting the necessary material for this work devolved mainly upon Dr. Hunter, and was only completed after seventeen years of labor and research. Valuable assistance, however, was rendered by his colleagues, John Williams, A. M., S. J. Herrtage, A. B., and a number of noted European specialists. The chemistry articles were contributed by John Francis Walker, A. M., F. C. S., late Examiner in Chemistry in Sidney Sussex College, Cambridge, and by William Harkness, F. I. C., F. R. M. S. T. Davies, F. G. S. of the Mineralogical Department, British Museum, furnished the bulk of the matter on Mineralogy and Petrology. Information regarding military matters was contributed by Lieut.-Col. Cooper King, R. M. A., late Professor at the Royal Military College, Sandhurst; while the Department of Music was ably conducted by Sir John Stainer. It is impossible to mention by name all who contributed directly or indirectly to lighten the labors of Dr. Hunter in securing accuracy and in bringing this work to completion.

Presidents, secretaries and members of scientific societies, the chief officers of religious bodies, university professors, government officials and a host of private persons rendered willing help by affording information in many cases possessed by themselves alone. Chief among these voluntary helpers were Dr. Gunther, F. R. S., Keeper of the Zoölogical Collections; Mr. Carruthers, F. R. S., Keeper of the Botanical Collections; Mr. J. Davies, F. G. S., Palæontological Department; and Mr. Britten, F. L. S., Botanical Department in the British Museum; Dr. Sclater, F. R. S., Secretary, Mr. Waterhouse, Librarian, and Mr. A. D. Bartlett, Superintendent, of the Zoölogical Society; Prof. Huxley, F. R. S., Prof. T. Rupert Jones, F. R. S., late Professor at the Royal Staff College, Sandhurst, Dr. Moir, L. R. C. S., and the late Prof. R. A. Proctor.

This work occupies a distinct place in the front rank of lexicographical works. It has received the unstinted praise of critics and the endorsement of leading authorities. According to *Webster's International Dictionary*, "It is the most copious in its list of words, and is more nearly allied, than are the others in its system of pronunciation, to

the long promised but still incomplete *New English Dictionary on Historical Principles*, which is edited by James A. H. Murray, LL. D., though it is far more simple than the latter in its notation of sounds."

Growth of Language. The study of the English language, in its entirety, requires a dictionary peculiarly adapted to its many complexities. The manifold shades of meaning which words possess necessitate a work of a higher order than a mere vocabulary. The inevitable progress of art, science and literature—the ever-widening circle of human knowledge—demands that a thorough and complete dictionary should be also an encyclopædia, practical as a book of reference and adapted to the recent growth of the language.

"Language is in a condition of constant growth and change," says Professor Whitney, in his *Life and Growth of Language*. "An English speaker even of only a century ago would find not a little in our every-day speech which he would understand with difficulty, or not at all; if we were to hear Shakespeare read aloud a scene from one of his own works, it would be in no small part unintelligible (by reason, especially, of the great difference between his pronunciation and ours); Chaucer's English (500 years ago) we master by dint of good solid application, and with considerable help from a glossary; and King Alfred's English (1,000 years ago) which we call Anglo-Saxon, is not easier to us than German. All this, in spite of the fact that no one has gone about of set purpose to alter English speech, in any generation among the thirty or forty that have lived between us and Alfred, any more than in our own. Here, then, is another side of the life of language for us to deal with, and explain, if we can. Life, here, as elsewhere, appears to involve growth and change as an essential element, and the remarkable analogies which exist between the birth and growth and decay and extinction of a language and those of an organized being, or of a species, have been often enough noticed and dwelt upon; some have even inferred from them that language is an organism and leads an organic life, governed by laws with which men cannot interfere."

Words acquire new meanings as new conditions arise. The *kinetoscope* of Perigal was a very different instrument from the *kinetoscope* of Edison. This is also true of more common words. *Bodkin*, for instance, is no longer applied to a dagger, but has a more peaceful significance.

The great number of mechanical inventions and scientific improvements have necessitated the almost unlimited coinage of new words. According to a well-known authority there is not one of the prize machines of the World's Fair of 1854 in use to-day, but all are to be found in the piles of scrap iron. The chief features of the Paris Exposition of 1900 were not dreamed of in 1883. The stories which the father of to-day tells his son, of his own boyhood, sound like tales from ancient history.

Requisites of a Dictionary. In this era of rapid change and growth, the position of the dictionary becomes a critical one. A most important question in the consideration of such a work is: What are the requisites of a thorough and complete dictionary?

It should contain all the authorized words of the language, with the forms of orthography which they have successively assumed. A dictionary is no longer an idol to be devoutly worshiped by the student of the language, neither is it a supreme court of reference whose decision is final. It should embody a complete but simple system of pronunciation, based upon the usages of the best-speaking English people. It should trace the etymological history of each word from its original domestic root or foreign analogue, to its latest form. It should give the original and present meanings of each word, with illustrative examples of its various uses. It should contain a complete list of idiomatic and other phrases, which have acquired a special meaning foreign to the individual significance of the words which compose them. Finally, such a work should contain comprehensive, encyclopædic matter relative to art, science and literature, and all recent discoveries and improvements.

Plan of the Work. This *Dictionary* is not a mere list of words alphabetically arranged. Neither are its contents to be estimated by the large number of words included in its vocabulary, for each word is considered and defined with reference to every part of speech in which it can be properly used, and also with reference to the various meanings it has assumed during the growth of the language. The work defines over 250,000 words, including an exhaustive list of obsolete words from the time of Chaucer to the present day, together with foreign words and phrases current in this country. Besides the necessary Encyclopædic matter, found in the body of the dictionary, the work contains an Appendix devoted to biographical, historical, geographical, statistical, classical and other information of great practical value.

Technology. The editors have prepared a list of technical terms, which, after careful revision, form a most important feature of the work. These are of great value from a scientific and practical standpoint and the collection is virtually complete. The elaboration of the list has been accomplished in such a manner that it is of value to the average reader as well as to the *savant*. The rapid advancement made by the arts and sciences has multiplied

the number of technical terms in a corresponding degree. The list of technical words and phrases found in these volumes includes all terms bearing directly upon theology, law, philosophy, mathematics, chemistry, medicine, geology, fine arts, engineering, mechanics, handicrafts and other subjects.

Cant and Slang. The compilation of a dictionary involves the consideration of many words which properly belong to the category of cant and slang. The editors were obliged to use great caution, both in the acceptance and rejection of such words. Certainly, many that were found inconsistent with the needs of a dictionary were often more expressive than so-called legitimate words. Those inserted are words in common use among the English-speaking people. These, however, are given their proper character by a distinction between them and more authoritative words. The lexicographer cannot wholly ignore slang. It exerts a strong influence on the language and is developed according to its laws. Many words which originate as slang finally take their places in the language of literature and speech. The word *slang* itself, which has occupied a position in the language since the middle of last century, is comparatively a recent word in reputable dictionaries.

Colloquialisms. Great discrimination must needs be exercised in the treatment of colloquialisms. Many of the so-called colloquial words and phrases are entitled to a recognition in the language. Many words and phrases peculiar to Americans and known as Americanisms are of classical origin, and often reflect the distinctive characteristics of the people who use them. The word *corn*, for instance, was perverted from its former function, as a general name for cereal grains, to mean *maize*. Where there has been a distinct corruption of meaning, as is the case with many colloquialisms, they have been placed in a special department, at the end of the work.

Special Coinages. During the past few years English words have been coined in large numbers. These words are often interesting, as well as expressive, and, when reputable authorities have sanctioned their use, should be admitted into the vocabulary. To place these words in a special list would only narrow the scope of this work.

Semi-naturalized Words. The incorporation of foreign words into our language is a gradual and almost imperceptible process. Yet there can be no doubt of the propriety of admitting such words to a place in any dictionary, when, by constant use, their value has been made evident and custom has robbed them of their foreign significance. The lexicographer needs only to guard against the insertion of too recent importations, in the selection of such words.

Hybrid Compounds. The prevalence of hybrid words emphasizes the resources and demands of the English language. Whenever a condition or object comes into existence which fails to find adequate form or expression in our own tongue, words from two different languages are often used in conjunction with each other. The word *cosmolangue* is a fitting example of such a union. The word is formed by the compounding of the Greek word *cosmos*, world, with the English word *language*. Hence, *cosmolangue* means a world-language. The word *cablegram*, which caused a lengthy discussion among English philologists, before it was finally accepted, was formed by uniting the English word *cable* with the Greek word *gramma*, a writing.

In the compilation of this *Dictionary* the various styles of type adopted afford an easy means of distinguishing the different divisions and subdivisions of words.

A system has been inaugurated which affords great convenience in reference. For instance, verbs are first divided into transitive and intransitive. These are again subdivided; firstly, into their ordinary meanings and secondly into their technical significations. A further subdivision is then made into literal and figurative meanings. The same system is adopted in the cases of adjectives, adverbs and nouns. The various grammatical parts of speech in which a word occurs are grouped under one heading, with definitions of each part, illustrated by quotations. Words of the same form, but from different roots, are placed under different headings.

Complete and comprehensive information on any encyclopædic subject can be readily obtained by means of a system of cross references to kindred topics. Turn to a single word of many that might be instanced—*evolution*. The spelling, pronunciation, definition and etymology are first given. Then follows the ordinary use of the word, literally and figuratively. Then the technical meanings are given, in astronomy and geology, biology, geometry, mathematics, and military. Definitions, quotations, and citations are given under all these subheads, so that the reader can obtain not only every shade of the meaning of the word, but a world of knowledge in those various departments. Under biology, reference is made to epigenesis. Turning to *epigenesis*, the reader will find the word spelled, pronounced and defined, and the scientific process described fully enough for any

P R E F A C E.

one to learn its gist, with references to Wolff, its first annunciator, in 1759; Haller, its opponent, and Haeckel, one of its great advocates. Reverting to the word *evolution*, the development hypothesis or theory is mentioned. Under the word *development* is given a full description of the doctrine, with references to Owen, Buffon, Lamarck, Saint-Hilaire, Hugh Miller, Spencer, Wallace, Darwin and Haeckel, and a reference to "Darwinism." *Darwinism* gives us the biography of Darwin, a list of his books, a minute description of his hypothesis under seven distinct heads, with more than 1,500 words in explanation of them. Again, in the course of the account of Darwinism, reference is made to *transmutation*, under which word will be found a full definition of both transmutation and transmutation hypothesis, also a reference to *transformation*, which word, with its compounds, occupies a space of one and one-half columns. Under the word *evolution* the theory is fully explained with reference to Haeckel, Darwin, Huxley and their works. By means of these cognate descriptions the reader has learned the substance of the subject, and that, too, in a dictionary.

The etymologies given are based upon the latest and best authorities. The cognate forms in other languages of each word are shown distinct from the roots.

Derivative signs similar to the following will often be found after words: "In Fr...Sp...Port...Ital...from Lat..." This implies that there have been analogous words in French, Spanish, Portuguese and Italian, all derived, like the English, from a Latin original. Where a word occurs that is taken from a language usually expressed, in other dictionaries, by foreign typography, the foreign characters are omitted and the nearest English equivalents are substituted. An abbreviation is placed before the word, showing from what language it is taken. Such transliteration is of value to the average reader who is unfamiliar with foreign typography.

This work abounds in illustrative quotations from the literature of the language. Many of these quotations are taken from newspapers and periodicals, the editors being of the opinion that no other source affords so many instances of words in every-day use, which represent the peculiar elements of the English language. "It is the growth of the newspaper press which has given importance to the English oral language," says a noted writer. "While the lexicographer is hesitating, weighing, suspending, harshly rejecting or tardily admitting, a language is being worked out, which will react again upon our literature. Apart from philological considerations, the mark of the spoken language, distinguishing it from the written language, is that it lives and breathes instinctive with the inspiration of the moment, receiving new ideas as they are newly born, fresh with the quick growth of an age of rapid progress and teeming invention."

The work is copiously illustrated, in a manner appropriate to the subjects treated.

The pronunciation of words is shown by a complete system of diacritical marks, the key to which is printed at the bottom of each page.

Obsolete words are distinguished by an asterisk (*), while words that are still in use though rarely found either in the spoken or written language, are marked with an obelisk (†).

No attempt has been made to introduce any phonetic or other system of spelling. The successive forms of orthography which it has assumed are given under each word.

The publishers take pleasure in presenting to the public a work high in aim, complete in detail, and thorough in conception. They are confident it will prove a valuable adjunct to the literature of the day.

GUIDE TO THE PRONUNCIATION.

In this dictionary the pronunciation is shown by diacritical marks, and the precise value of every vowel, whether accented or unaccented, is clearly and exactly indicated.

Where two or more vowels occur together and do not form a diphthong, only that one of them which gives its sound to the syllable bears a diacritical mark, the others being treated as mute.

The following table illustrates the use of the marks:

RULES FOR FORMING PLURAL NOUNS AND DERIVATIVES.

Formerly a great deal of space in dictionaries was taken up by the insertion of regularly formed plural nouns and derivatives, but modern lexicographers are inclined to exclude such words on the ground that the simple rules governing their formation are generally understood as to make their insertion unnecessary. Following are the rules :

1. RULES FOR THE FORMATION OF PLURALS.

(1) The plural of nouns is generally formed by adding *s* or *es* to the singular.

(2) Words ending in a sound that will unite with the sound of *s*, form the plural by adding *s* only; as, *bird, birds*; *bee, bees*.

(3) Words ending in a sound that will not unite with the sound of *s*, form the plural by adding *es*; as, *box, boxes*; *church, churches*; *sash, sashes*.

Exception: When such words end in a silent *e*, the plural is formed by adding *s* only; as, *race, races*; *rose, roses*.

(4) Most nouns ending in *o* preceded by a consonant form the plural by the addition of *es*; as, *cargo, cargoes*; *hero, heroes*.

Exceptions: The following nouns are commonly written in the plural with *s* only: *Albino, canto, grotto, motto, negrito, octave, Pueblo, quarto, solo, tyro, and zero*.

(5) Some nouns ending in *f*, or *fe*, change their termination into *ves* in the plural; as, *leaf, leaves*; *shelf, shelves*. Others, as, *chief, dwarfs, grief, gulf, handkerchief, hoof, proof, roof, reproof, safe, scarf, strife, surf, turf*, and most of those ending in *ff* form the plural regularly; as, *chief, chiefs*; *muff, muffs*.

(6) Nouns ending in *y* after a consonant form the plural by changing *y* into *ies*; as, *candy, candies*. But nouns ending in *y* after a vowel, form the plural regularly; as, *day, days*; *chimney, chimneys*.

(7) Compound words, whether hyphenated or solid, usually form the plural regularly; as *handful, handfuls*; *house-top, house-tops*. But words composed of a noun united to an adjective, or of two nouns connected by a preposition, so as really to constitute a phrase generally form the plural by adding *s* to the first word of the compound; as, *court-martial, courts-martial*; *cousin-german, cousins-german*; *knight-errant, knights-errant*; *son-in-law, sons-in-law*.

Many nouns adopted from foreign languages retain their foreign plurals; as, *alumnus, alumni*; *crisis, crises*. The instances in which this occurs are indicated in their proper places in the dictionary.

2. FORMATION OF DERIVATIVES.

(1) Words ending in silent *e*, generally reject the *e* before an additional syllable beginning with a vowel; as, *move, moving, movable*.

Exceptions: (a) Words ending in *oe* retain the final *e*; as, *shoe, shoeing*; *hoe, hoeing*; (b) when *e* is preceded by *c* or *g* it is retained before *able* or *ous*; as, *peaceable, courageous*; (c) the *e* is retained in a few words to prevent ambiguity, as in the word *singeing* to distinguish it from *singing*; in *dyeing* (coloring), to distinguish from *dying* (expiring).

(2) Words ending in silent *e*, generally retain *e* on receiving an additional syllable beginning with a consonant; as, *large, largely*.

Exceptions: *Due, duly*; *true, truly*; *awe, awful*; *judge, judgment*; *abridge, abridgment*; *acknowledge, acknowledgment*; *argue, argument*.

(3) Words ending in *y* preceded by a consonant, change *y* into *i* on receiving an addition, unless this addition is 's or a syllable beginning with *i*; as, *carry, carrier, carries*; *fancy, fancied, fanciful*; *lady, ladies*; *lady, lady's*; *carry, carrying*.

(4) But words ending in *y* preceded by a vowel, generally retain the *y* on taking an increase; as *boy, boyish, boys*; *delay, delayed, delays*; *say, says*.

Exceptions: *Lay, laid*; *pay, paid*; *say, said*; commonly, *stay, staid*; and most of their compounds; as, *mis-laid, unpaid*, etc.

(8) But when a diphthong precedes the final letter, or when the accent is not on the last syllable, the consonant is not doubled on assuming an additional syllable; as *toil, toiler, toiling*; *deposit, depositor, depositing*.

(9) Words ending in a double consonant generally retain both consonants on receiving an addition; as, *call, caller, calling, calls*; *ebb, ebbled, ebbing, ebbs*.

Exceptions: Some words ending in *ll*, drop one *l* on receiving an increase beginning with a consonant; as, *ful, fulfill, fulfilling, fully*.

THE NEW AMERICAN ENCYCLOPÆDIC DICTIONARY.

A

A, a. The first letter in the English alphabet, as in those of all the modern Indo-European tongues. The Latin alphabet also commences with *a*, and the Greek with a similar letter, *alpha*. In Sanscrit the vowels are classified by grammarians separately from the consonants. The vowels are placed first, and two sounds of

a, the first a very short one, intermediate between *â* and *û*, as in the word *Veda*, and the other long, as in the first syllable of *Brahman*, head the list. In the Semitic, also, more accurately called the Syro-Arabian, family of languages, a letter with the *a* sound stands first in order. Thus the Hebrew alphabet commences with *A* (*Aleph*), followed in succession by *B* (*Beth*), *C* (*Gimel*), *D* (*Daleth*), designations which at once suggest the names of the Greek letters *Alpha*, *Beta*, *Gamma*, *Delta*. The comparative originality of the Hebrew series is shown by the fact that the appellations of the letters have meanings which the original forms of the characters are supposed roughly to represent: thus, *A* (*Aleph*), signifies an ox, *B* (*Beth*) a house, *C* (*Gimel*) a camel, and *D* (*Daleth*) a door. These terms are properly Aramæan. The old Hebrew, the Aramæan, and the Greek letters seem to have come from the Phœnician, a Syro-Arabian tongue. The Phœnician letters, again, as Gesenius suggests, may have been derived from the Egyptian hieroglyphics. [ALPHABET.] The arrangement which makes *A* the first letter extends far beyond the Aryan and Syro-Arabian tongues, and is believed to be nearly universal through the world.

I. *A* as a vowel sound.

A owes its position at the head of so many alphabets to the facility with which it may be pronounced: it is needful but to breathe strongly through the open mouth, and one of the *a* sounds comes forth. This letter has three leading sounds, two of which again are somewhat modified in many words, apparently by the succeeding consonants.

1. The long sound of *A*:

- (i.) As in *fate*, marked in this work by *â*.
- (ii.) A modification of this sound, produced by the consonant *r* following it, as in *fare*, marked *â*.

2. The open sound of *A*:

- (i.) As in *father* (marked *a*). This, or a sound much approaching it, is common in many languages.

¶ A trifling modification of this sound is produced by its occurrence in a closed syllable, as in *fast*, but it is not sufficiently distinct from it to require a special diacritical mark.

- (ii.) A shorter form of the open sound in a closed syllable, as in *fat*. It is here marked *â*.

- (iii.) The shortest possible sound of *A*, scarcely distinguishable from one of the *u* sounds, as in *amidst*. It is here marked *â*. It is very common in Sanscrit words, as *Veda*.

3. The broad sound of *A*:

- (i.) As in *fall*, here marked *â*.
- (ii.) A closer form of it, marked *â*, as in *what*.

II. *A* as an initial is used:

1. In *Chronology*, for *Anno* (Lat.)=in the year: as *A. D.*, *Anno Domini* = in the year of our Lord; *A. U. C.*, *Anno urbis condite* = in the year of the city founded—i. e., from the foundation of the city (Rome) = 753 B. C. (*Varro*).

2. In *Horology*, for the Lat. prep. *ante* = before: as *a. m.* (*ante meridiem*) = before noon.

3. In designating University degrees, for *Artium*: as *A. M.* (Lat.), or *M. A.* (Eng.), *Artium Magister* = Master of Arts; *A. B.* (Lat.), or *B. A.* (Eng.), *Artium baccalaureus* = Bachelor of Arts.

¶ In England *M. A.* and *B. A.* are almost exclusively employed, while in the United States *A. M.* and *A. B.* are used.

4. In *Academies of Music, Painting, Science, &c.*: (a) for *Academy*, or *Academician*, as *R. A.* = Royal Academy; or (b) for *Associate*, as *A. R. A.* = Associate of the Royal Academy; or (c) for *Antiquaries*, as *F. S. A.* = Fellow of the Society of Antiquaries.

5. In the *Army*, for *Artillery*: as *U. S. A.* = The United States Artillery, or United States Army.

6. In *Music*, for *alto*: as *S. A. T. B.* = Soprano, Alto, Tenor, Bass.

7. In *Nautical Language*, for *able*. Thus, *A. B.* = able-bodied seaman.

8. In *Commerce*, for *accepted*, and is used specially of bills.

III. *A* as a symbol stands for—

1. In *Logic*: *A* universal affirmative.

2. In *Music*: The 6th note of the diatonic scale of *C* major, corresponding to the *la* of the Italians and the French.

3. In *Heraldry*: The chief in an escutcheon.

4. In *Pharmacy*: *a* or *aa* is a contraction of the Greek preposition *ana*, and has two meanings: (i.) of each (ingredient) separately; or (ii.) in quantities of the same weight or the same measure.

5. In *Botany*: According to the method of notation in botanical drawings proposed by Mr. Ferdinand Bauer, and followed by Endlicher in his *Iconographia Generum Plantarum*, for a flower before expansion, while *A 1* is a flower expanded.

6. In *Nautical Language*: *A 1* = a vessel of the first class, excellently built. *Figuratively*: Anything highly excellent, the best of its class.

7. In *Mathematics*: *A* and the other letters of the alphabet are used, e. g., in Euclid, to represent lines, angles, points, &c. In Algebra, *a* and the other first letters of the alphabet are used to express known quantities, and the last letters to express such as are unknown.

8. In *Law* or arguments, the first letters of the alphabet are used to indicate persons in cases supposed or stated for illustration: as *A* promises *B* to pay *C*.

IV. *A* used in composition:

1. As a prefix:

- (i.) To *English words derived from the A. S.*, generally means *an* (=one), *at*, *to*, *in*, *of*, *on*. It may be severed from the rest of the word by a hyphen, as *a-day*; or the two may be completely united, as *along*. *A* was once used as a prefix in many instances, especially to participles, where now it is not used: e. g., "I am *a-going*, or *a-coming*," are now confined to the vulgar, and are not looked upon as correct. But Max Müller considers such phrases more accurate than those which have displaced them; and they are frequent in the Bible, as Heb. xi. 21. Cf. Shakespeare, *Merry Wives*, act iii., sc. 3, "We'll *a-birding* together." "In some cases," says Lye, "it was originally merely an initial augment, altering nothing in the sense of the word." Sometimes it=A. S. *ge*, as in *aware*=A. S. *gewær*.
- (ii.) To words derived from the Latin, is (1) the Latin prep. *a*, *ab*, *abs* (of which *a* is used before

words beginning with a consonant): as *avert*=to turn away from; *abduct*=to lead away; *abstract*=to draw away. (2) The Latin prep. *ad*=to: as *agnate*, from *agnatus*, past participle of *agnascor*=(properly) to be born to, or in addition to.

(iii.) To words of Greek derivation is sometimes what is called *alpha privative*; that is, *alpha* which deprives the word to which it is prefixed of its positive meaning, and substitutes what is negative instead. It signifies *not*: as *theist*=one who believes in God; *atheist*=one who does not believe in God. In cases where the word so contradicted begins with a vowel *an* is used, as *anelectric*, the opposite of *electric*.

(iv.) To words derived from the French, occasionally, but rarely, *at*: as *amerce*, from Fr. *à merci*=(put) at the mercy (of the court).

(v.) *à* [apparently, from its accent, French, but probably really only the Latin prep. *a*=from; and the accent is a mark of its having come to us in this use through the French], in English, sometimes=*from*. (1.) Noting paternity, especially of an honorable kind, as Thomas *à* Becket=Thomas Becket; Anthony *à* Wood=Anthony Wood. (2.) Logical progression, as in *à priori* and *à posteriori* (q. v.).

2. As an affix in burlesque poetry at once adds another syllable to a line, and produces a ludicrous effect—

"And chuck'd him under the chin-*a*."—*Rhymes quoted in Macaulay's "Hist. of Engl."* chap. xvii.

V. *A* as a part of speech.

A, æ, Æn. [a before words commencing with a consonant or the aspirate; *an* before a vowel or silent *h*: as "a man," "a heart," "an art," "an heir." To this rule there are exceptions:

- (1) When the accent on a word commencing with the aspirate falls on other than the first syllable, *an* is frequently used: as "an historian," "an hotel."

- (2) *A* is used before the vowel *o* in *one* where the vowel carries the sound of *wo*, as in the phrase "such a one."

- (3) *A* is used before the vowel *u* when it carries with it a *y* sound, as if written *you*, as "a union," "a university;" and also before words commencing with *eu* or *ew* which have a similar sound, as "a eunuch," "a ewe."

¶ Originally *an*, meaning *one*, was used before words beginning with a consonant, as well as those beginning with a vowel. In earlier English, as in the Bible, we find *an* generally used before words commencing with *h*, whether aspirated or not, as "an house," "an heart." "Such an one" occurs as frequently as "such a one." *An* is found before *u* with the *y* sound, as "an unicorn," "an usurer." These uses have been followed by many modern writers, but chiefly in poetry. Macaulay speaks of "an university."

The syllable *ab* found at the commencement of the names of places, as Abingdon, is possibly a shortened form of *abbey*; though in Stevenson's edition of the *Chronicon Monasterii de Abingdon* the word is derived from Abbenus, an Irish monk who is said to have founded the monastery and called it after himself, "Mount of Abbenus" = Abingdon. (See Stevenson's Preface, p. xii.)

Falconer: *Shipwreck*.

¶ *Taken aback* means (a) that the sails have been driven in the opposite direction from that in which the ship is advancing, and laid against the mast. This may be produced by a sudden change of the wind, or by an alteration in the ship's course. A ship is *laid aback* when the sails are purposely put back to destroy the forward motion of the vessel, or even make her temporarily move stern foremost, to avoid some danger ahead. Ships of war are also laid *aback* when they have advanced beyond their places in the line of battle. Hence (b) *metaphorically* from the above=taken by surprise.

āb'-a-cūs, s. [*Ger. abacus*; *Fr. abaque*; *Ital. abaco*, fr. *Lat. abacus*; *Gr. abax*, -akos. The word appears to have signified originally and specially the Pythagorean multiplication table, and thus to have been derived either from the first two letters of the alphabet, or from the Heb. *abag*=dust, or a corresponding term in some other Syro-Arabian language; the allusion being to the ancient practice of spreading dust on tablets, with the view of tracing diagrams among it. Hence its various significations, which are the same in English as they are in Latin.]

1. A counting-frame; an instrument made of wires and beads designed to facilitate arithmetical calculations. It was used in Greece as well as in Rome, and is still employed in China, where it is called *Shwanpan*. In America an abacus of a humble kind is occasionally sold in toy shops.

Abacus, for Counting.

2. *Arch.*: A flat stone crowning the capital of a column. It was square in the Tuscan, Doric, and all the ancient Ionic styles. In the Corinthian and Composite orders the sides were hollowed, and the angles in nearly all cases truncated. It is the same in some of the modern Ionic. In the Grecian Doric, the Roman Doric, and the Tuscan, the abacus was thick, while it was thin in the Doric and Corinthian. It was to these last forms that Vitruvius, the Roman writer, who introduced the word *abacus* into architectural nomenclature, limited the term. The checker and tile, the abacus of the Doric, he denominated *plinthus* or *plinthis* = a plinth.

abbé (pron. āb'-bā), s. [The French term for *ABBOT*.] Literally, the same as an abbot, but more generally a mere title without any definite office or responsibilities. Before the first French Revolution the title was so fashionable that many men who had pursued a course of theological study,

fāte, fāt, fāre, amidst, whāt, fāll, father; wē, wēt, hēre, camel, hēr, thēre; pīne, pīt, sīre, sīr, marine; gō, pōt, or, wōre, wpif, wōrk, whō, sōn; mūte, cūb, cūre, unite, cūr, rāle, fāll; trȳ, Sȳrian. æ, œ = ē; ey = ā. qu = kw.

though not at all of ecclesiastical proclivities, assumed it; but that practice almost terminated with 1789, after which the word became once more limited to its natural meaning.

āb'-beŷ, s. [O. Fr. *abeie*, *abae*; Fr. *abbaye*, from Low Lat. *abbatia*; Ital. *abbazia* or *badia*; Ger. *abtei*.]

1. A monastic community. A society of celibates of either sex, who, having withdrawn from "the world" and bound themselves by religious vows, henceforth live in seclusion, the men, termed *monks*, in a convent, and the females, denominated *nuns*, in a nunnery, the former ruled over by an *abbot* [ABBOT], and the latter by an *abbess*. Originally, the term *abbey* was applied to all such fraternities or sisterhoods, then it became more limited in meaning, as a distinction was drawn between an *abbey proper* and a *priory*. The more powerful abbeys in the Middle Ages tended to throw out offshoots, as a vigorous church now is pretty sure to found one or more humbler churches in its vicinity. These were called *priories*, and were ruled by priors, which was a more modest dignity than that of abbot. For a period they were subject to the authority of the abbot by whose instrumentality they had been founded, then they gained strength and became independent of the parent monastery, and finally the distinction between an *abbey* and a *priory* almost vanished. [MONASTERY.]

2. A building either now or formerly inhabited by a monastic community. An abbey in the Middle Ages had a church, a dormitory, a refectory for meals, a proper pantry for viands, and all other conveniences for the monks, who, though individually poor, were collectively rich. It stood in the midst of grounds walled round for protection and privacy. Some abbeys have been converted into modern cathedrals or churches, others are in ruins. [PRIORY, CONVENT, NUNNERY, MONASTERY.]

"It is impossible to conceive a more beautiful specimen of lightness and elegance of Gothic architecture than the eastern window of Melrose Abbey."—Scott: *Notes to "Lay of Last Minstrel"*, ii. 8.

¶ In London "*the Abbey*" signifies Westminster Abbey.

abbey-land, s. Land now, or formerly, attached to an abbey. On the suppression of the monasteries at the period of the English Reformation, the abbey-lands were transferred to the Crown, and were soon afterward given, at prices beneath their value, to private persons. By the statute 1st Phil. & Mary, c. 8, any one molesting the possessors of abbey-lands, granted by Parliament to Henry VIII. or Edward VI., incurred the penalty of a premunire. While yet the lands now referred to were attached to the respective abbeys, their possessors, in most cases, had succeeded in freeing them from all charge for tithes. When their modern owners manage to prove this they also are exempt from tithe rent-charge. (See Blackstone's *Commentaries*, Book IV., ch. 8; Book II., ch. 3.)

abbey-lubber, s. A term of contempt for a fat, lazy, idle monk. It is still used.

"This is no Father Dominic, no huge overgrown *abbey-lubber*; this is but a diminutive, sucking friar."—Dryden: *Spanish Friar*, iii. 2.

¶ Besides *abbey-land* and *abbey-lubber* there are in English literature a number of other words compounded with *abbey*; for instance, *abbey-church* and *abbey-plate* (Froude), *abbey-gate* and *abbey-wall* (Shakespeare).

āb'-bōt, ***āb'-bat**, or **āb'-ōt**. [A. S. *abbod*, *abad*; Ger. *abt*; Fr. *abbé*; Ital. *abate*; Low Lat. *abbas*, fr. E. and W. Aram. *abba*; Heb. *ab*=father, of which the plural sounds like *abbot*, *aboth*. [ABBA.]

A term originally applied to any monk, or to any ecclesiastic, specially if aged, and designed to express veneration for his sanctity; then limited to the superior of a society of monks living in a monastery; next restricted still further to the ruler of an abbey as contradistinguished from a priory; and, finally, acquiring again a somewhat more extended meaning as the distinction between an abbey and a priory became less regarded. [ABBEY, PRIORY.]

When in the fourth century, A. D., the scattered and solitary monks living in the Egyptian and other deserts began to be gathered into small communities, each society elected a spiritual chief over it, to whom the name *abbot* was given by the Syrians and others, and *archimandrite* by the Greeks. The bishop soon gained the right of confirming the nomination. As yet the abbots were deemed laymen, but about the sixth century most of them became priests. After the second Nicene Council, in A. D. 787, they were allowed to consecrate monks for the lower sacred orders. The abundant leisure which they possessed led a few of them to become learned men, and the bishops finding them useful in controversies with "heretics," gradually induced them to remove their monasteries to the vicinity of towns. By the eleventh century their influence had so increased that the more powerful of them succeeded in shaking off the authority of the bishops, owning no jurisdiction now but that of the Pope; these were, in consequence, called *insulated abbots*. Though nominally the next grade below bishops, yet most of them adopted the episcopal crosier, which, however, they bore in their right hand, while the bishops did so in their left. They also assumed mitres like their rivals, and even many ordinary abbots became crosiered; thus a distinction arose between *mitred* and *crosiered abbots*. The houses presided over by insulated abbots had mostly sent forth priories; the heads of those which had done so on a large scale were sometimes called *cardinal abbots*; and the ambitious title of *ecumenical*, meaning *universal abbot*, imitated from the patriarch of Constantinople, was not unknown. The privilege of making appointments to posts of such importance was claimed, and in many places successfully, by the civil power, which then nominated laymen for secular ends. Hence arose *abbot-counts* (in Lat. *abba*- or *abbi-comites*) and *field-abbots* (in Lat. *abbates milites*), who received appointments on condition of rendering military service for what was deemed their feof. In Germany there were *prince abbots*, and Kings Philip I. and Louis VI. of France were abbots of the monastery of St. Aignan. In England, before the Reformation, twenty-six or twenty-seven mitred abbots, with two priors, sat in the House of Lords; the former were called, in consequence, *abbots-general*, or *abbots-sovereign*. They ceased to be peers when the monasteries were suppressed by Henry VIII.

Bishops whose cathedrals were at one time abbeys have sometimes been called abbots.

In modern Roman Catholic countries abbots are generally divided into *regular* and *commendatory* (*abbés commendataires*). The former are really monks; the latter are only laymen, but are obliged to take orders when they have reached the right age.

¶ *Abbot of the People* was a title formerly given in Genoa to one of the chief civil magistrates, a layman. A person who in mediæval times was the leader of Christmas revels was called by the English the *Abbot* or *Lord of Misrule*, by the Scotch the *Abbot of Unreason*, and by the French *Abbé de Liesse*=the Abbot of Joy. [MISRULE.]

1. That portion of the trunk which in man commences beneath, and in mammalia behind the diaphragm, and terminates at the extremity of the pelvis. The abdominal cavity is the largest in the human body. It is lined with a serous membrane called the peritoneum. It contains the liver, with the gall-bladder, under its right lobe, the stomach, the pancreas, the spleen, the two kidneys, the bladder and the intestines. The more highly organized of the inferior animals have a similar structure.

2. *Entom.*: The whole posterior division of the body united to the thorax by a small knot or attachment, well seen in the wasp. It includes the back as well as the parts below. Externally it is made up of a series of rings.

Abdominal regions: Certain regions on the external surface of the abdomen formed by the tracing upon it of imaginary lines. A line is drawn horizontally from the extremity of the last rib on one side to the same point on the other. A second line is then drawn parallel to the first between the two anterior superior processes of the ilium. These two lines necessarily divide the abdomen into three horizontal bands or zones. The first or highest one is called the epigastrium [EPIGASTRIUM]; the second or middle one, the umbilical region [UMBILICAL]; and the third or lowest the hypogastrium [HYPOGASTRIUM]. Two vertical lines are then drawn on either side from the cartilage of the seventh rib downward to the anterior superior spine of the ilium. These necessarily intersect the three horizontal zones, dividing each of them into three parts so as to make nine in all. The central division of the epigastrium constitutes the epigastric region, properly so called, on either side of which lie the right and left hypochondria [HYPOCHONDRIA]. The central portion of the umbilical region is the umbilical region properly so called; whilst the compartments on either side are named the right and

left lumbar regions. The hypogastric region is similarly divided into three, the central called the pelvic region, and the two side ones the right and left iliac regions.

Abdominal ring or inguinal ring: One of two oblong tendinous openings or "rings," existing in either groin. Through these rings pass the spermatic cord in the one sex, and the circular ligament of the uterus in the other. The aponeurotic fibres which form the immediate boundaries of the two openings are called the pillars of the ring. One of these is superior, internal or anterior, and the other inferior, external and posterior.

The Abdominal and Thoracic Regions.

The oath of abjuration was fixed by 13 Wm. III., c. 16. By the 21 & 22 Vict., c. 48, one form of oath was substituted for the oaths of allegiance, supremacy, and abjuration. For this form another was substituted by the Act 30 & 31 Vict., c. 75, s. 5. 2. *Spec.*:

(a) The sixth and last case in the Latin language. An extant fragment of Julius Cæsar's *De Analogia* informs us that he was the inventor of the term in Latin. He found time to introduce it during his Gallic War. The ablative case expresses a variety of relations, such as separation, instrumentality, position in time and place, and these we express in English by the prepositions *from*, *by*, *with*, *in*, *at*, &c.

(b) Pertaining to the sixth case in the Latin language.

¶ The word is, no doubt, originally an adjective, as in Latin; but as in that language there is frequently an ellipse of the substantive *casus*, so in English we find ablative standing by itself, and it is thus used—

II. *As a substantive*:

"The *ablative* denotes the moving cause."—*Schmitz: Lat. Gram.*, § 291.

¶ The *ablative absolute* is a mode of expression in Latin by which, in a subordinate clause detached from the rest, the subject is put in the ablative, and the verb is changed into a participle, and made to agree with it: as, *Reluctante naturâ irritus labor est*=exertion is useless, nature being against it, *i. e.*, when nature is against it.

¶ There is an ablative in the Chinese as well as the Latin language. (See Max Müller.)

It will be observed that the name *abracadabra* can be read not only on the uppermost horizontal line, but on any of the lines below it, with a continuation, slantingly upward, on the right-hand side of the triangle. So can it also on that right-hand line, or any one parallel to it, the continuation in the

latter case being on the uppermost line toward the right hand. A paper inscribed in such a fashion, and hung around the neck, was supposed to be a tacit invocation of the Syrian deity mentioned above, and was recommended by the sapient Serenus Saronicus as an antidote against fever and various other diseases. Shortly before A. D. 1588, a quack doctor, who charged £15 for his prescription, made a patient suffering from ague much worse, by inducing him to eat the charm instead of wearing it round his neck.

"... A little afore his fit was at hand he called unto the wife of the patient to bring him an apple of the largest size, and then with a pinne write on the rinde of the apple *Abacadabra*, and perswade him to take it presently in the beginning of his fit, for there was (sayth he) a secret in those words. To be short, the patient, being hungry of his health, followed his counsell, and devoured all and every piece of the apple."—*Cloves*, A. D. 1588.

Med.: A gathering of pus in any tissue or organ of the body. It is so called because there is an *abscessus* (=a going away or departure) of portions of the animal tissue from each other to make room for the suppurated matter lodged between them. It results from the softening of the natural tissues, and the exudations thus produced. Abscesses may occur in almost any portion of the body. They are of three types: the *acute abscess*, or phlegmon, arising from an inflammatory tendency in the part; the *chronic abscess*, connected with scrofulous or other weakness in the constitution; and the *diffused abscess*, due to contamination in the blood.

In an ellipse, the abscissæ of any diameter are the segments into which that diameter is divided by one of its own ordinates. In the ellipse *A B C D* (Fig. 3), *B Q* and *Q D* are the abscissæ of the diameter *B D*, corresponding to the point *A*.

3. *Law*: Failure to put in an appearance when cited to a court of law.

4. Inattention to things present. Often a person charged with "absence of mind" has his mind intensely present in some imagined scene or train of thought quite different from that with which the rest of the company are occupied. From their point of view, therefore, he manifests "absence of mind." In other cases the absent person is not particularly attending to anything, but is simply in a lethargic mood. In the same way we speak of an "absence of all thought."

I. Ordinary Language. Applied—

1. To God: Self-existent and completely uncontrolled by any other being.

"In judging of God's dispensation we must not look merely at His *absolute* sovereignty."—Elunt: *Dict. Hist. & Theol.*, art. "Decrees Eternal."

2. To a sovereign or sovereignty, or power in general: Uncontrolled, unchecked by any other human powers; arbitrary, despotic.

(b) Highly accomplished, perfect.

*5. Positive, undoubting, fully convinced.

6. Unconditional.

"... the words of his mouth are *absolute*, and lack nothing which they should have for performance of that thing whereunto they tend."—Hooker: *Eccles. Pol.*, ii. 6.

"The celebrated doctrine of an *absolute* decree of God respecting the salvation of mankind, which was unknown to Zwingli, was inculcated by Calvin."—Mosheim: *Ch. Hist.*, Cent. XVI.

II. Logic. According to Whately:

1. *Absolute* or *Non-connotative* is opposed to *Attributive* or *Connotative*. The former does not take note of an attribute connected with the object, which the latter does. Thus *Rome* and *sky* are *absolute* terms; but *Rome*, the capital of Italy, and our *sky* are *attributive* or *connotative*. (See Whately, *Logic*, bk. ii., ch. v., §§ 1, 2–5.)

bōil, bōy; pōut, jōwl; cat, çell, chorus, çhin, bench; go, gem; thin, ðis; sin, aș; expect, Xenophon, exist. ph = f. -cian, -tian = șan. -tion, -sion = șun; -țion, -șion = zhun. -tious, -cious, -sious = șus. -ble, -dle, &c. = bel, del.

2. According to J. S. Mill, it is incorrect to regard *non-connegative* and *absolute* as synonymous terms. He considers *absolute* to mean non-relative, and to be opposed to relative. It implies that the object is to be considered as a whole, without reference to anything of which it is a part, or to any other object distinguished from it. Thus *man* is an absolute term, but *father* is not, for *father* implies the existence of sons, and is therefore relative. (J. S. Mill, *Logic*, bk. i., ch. ii.)

III. *Metaph.*: Existing independently of any other cause.

"... this asserts to man a knowledge of the unconditional, the absolute and infinite."—Sir W. Hamilton: *Discussions*, &c., Append. i.

IV. *Gram.*: A case *absolute* is one consisting essentially of a substantive and a participle, which form a clause not agreeing with or governed by any word in the remainder of the sentence. In Greek, the absolute case is the genitive; in Latin, the ablative; in English, it is considered to be the nominative.

In Latin, the words *sole stante* in the expression, "*sole stante terra vertitur*" (the earth turns round, the sun standing still)—that is, whilst the sun is standing still—are in the ablative *absolute*.

In English, *thou leading*, in the words—

"I shall not lag behind, nor err
The way, *thou leading*" (Milton)

are in the *nominative absolute*. So also are *I rapt* in the line—

"And, I all rapt in this, 'Come out,' he said."
Tennyson: *Princess*, Prol. 50.

V. *Law*: Personal rights are divided into *absolute* and *relative*; *absolute*, which pertain to men as individuals; and *relative*, which are incident to them as members of society, standing in various relations to each other. The three chief rights of an absolute kind are the right of personal security, the right of personal liberty, and the right of private property. (Blackstone, *Comment.*, bk. i., ch. i.) Similarly there are *absolute* and *relative* duties. Public sobriety is a relative duty, whilst sobriety, even when no human eye is looking on, is an absolute duty. (*Ibid.*) Property in a man's possession is described under two categories, *absolute* and *qualified* property. His chairs, tables, spoons, horses, cows, &c., are his *absolute property*; while the term *qualified property* is applied to the wild animals on his estate.

An *absolute decision* is one which can at once be enforced. It is opposed to a rule *nisi*, which cannot be acted on until cause be shown, unless, indeed, the opposite party fail to appear.

Absolute law: The true and proper law of nature. *Absolute warrandice* (*Scotch conveyancing*): A warranting or assuring against all mankind.

VI. *Nat. Philosophy*: *Absolute* is generally opposed to *relative*. As this relativity may be of many kinds, various shades of meaning thus arise: thus—

1. *Absolute or real expansion of a liquid*, as opposed to its apparent expansion, the expansion which would arise when the liquid is heated, if the vessel containing it did not itself expand. (See Atkinson, *Ganot's Physics*, bk. vi., ch. iii.)

2. *Absolute gravity* is the gravity of a body viewed apart from all modifying influences, as, for instance, of the atmosphere. To ascertain its amount, therefore, the body must be weighed *in vacuo*.

3. *Absolute motion* is the change of place on a body produced by the motion so designated, viewed apart from the modifying influence arising from disturbing elements of another kind.

4. *Absolute space* is space considered apart from the material bodies in it.

5. *Absolute time* is time viewed apart from events or any other subjects of mental conception with which it may be associated.

6. *Absolute force of a center*: Strength of a center (q. v.).

VII. *Astron.*: The *absolute equation* is the aggregate of the optic and eccentric equations. [EQUATIONS, OPTIC, ECCENTRIC.]

VIII. *Algebra*: *Absolute numbers* are those which stand in an equation without having any letters combined with them. Thus, in the following equation—

$$2x + 9 = 17,$$

9 and 17 are absolute numbers, but 2 is not so.

IX. *Chem.*: *Absolute alcohol* is alcohol free from water.

X. *Therm.*: *Absolute Zero*. See ZERO ¶.

ăb'-sôl-ûte-lŷ, adv. [ABSOLUTE, a.]

I. With no restriction as to amount; completely.

"... how persistently an *absolutely* useless faculty may be transmitted."—Darwin: *Descent of Man*, vol. i., pt. i., ch. i., p. 20.

Church Hist.: A sect which appeared in France and Spain about the end of the third century. They were against marriage and the use of animal food, and are said to have regarded the Holy Spirit as a created being.

ābs-tort'-ēd, *a.* [Latin *abs* = from; *tortus* = twisted, pa. par. of *torqueo* = to twist.] Twisted away, forced away by violence.

ābs-trāct, *v. t. & i.* [In Ger. *abstrahiren*; Fr. *abstraire*; Ital. *astruere*, from Lat. *abstractus*, pa. par. of *abstraho* = to drag or pull away; *abs* = from, and *traho* = to draw.]

A. Transitive:

I. To drag or pull away; specially to take away surreptitiously, as when a thief abstracts a purse from some one's pocket.

II. To separate physically, without dragging away.

1. *Chem.*: To separate by distillation.

"Having dephlegmed spirit of salt, and gently *abstracted* the whole spirit, there remaineth in the retort a stypical substance."—*Boyle*.

2. *Writing*: To make an epitome of a book or document.

"... let us *abstract* them into brief compends."—*Watts: Improv. of the Mind*.

III. To separate the mind from thinking on a subject.

"Minerva fixed her mind on views remote, And from the present bliss *abstracts* her thought."

Pope: Homer's Odyssey, xix. 558, 559.

IV. To separate morally.

"That space the Evil One *abstracted* stood From his own evil, and for the time remained Stupidly good."—*Milton: P. L.*, ix. 463.

B. Intrans.: To perform the operation of abstraction; to distinguish logically; to attend to some portion of an object separately. (Followed by *from*.)

"Could we *abstract* from these pernicious effects, and suppose this were innocent, it would be too light to be matter of praise."—*More: Decay of Piety*.

ābs-trāct, *a.* [In Ger. *abstract*, *abstrakt*; Fr. *abstrait*; Lat. *abstractus*=dragged away, pa. par. of *abstraho*=to drag or pull away.] [ABSTRACT, *v. t.*]

A. Used as an adjective:

I. In Ordinary Language and Poetry:

1. *Gen.*: Abstracted, separated, viewed apart from.

(a) From other persons or things of a similar kind.

"... the considering things in themselves, *abstract* from our opinions and other men's notions and discourses on them."—*Locke*.

(b) From reference to an individual.

"Love's not so pure and *abstract* as they use to say Which have no mistress but their muse."

Donne: Poems, 27.

2. *Poet.*: For abstracted; absent in mind, like one in a trance.

"*Abstract*, as in a trance, methought I saw, Though sleeping, where I lay, and saw the shape."

Milton: Par. Lost, bk. viii.

3. Separate; existing in the mind only; hence with the sense of difficult, abstruse.

II. Logic and Grammar:

1. In a strict sense: Expressing a particular property of any person or thing viewed apart from the other properties which constitute him or it. Thus *depth* is an abstract term. Used of the sea, it means that the property of the sea expressed by the word *depth* is viewed apart from the other properties of the ocean. So is *blueness* an abstract word. In this sense *abstract* is opposed to *concrete*. This use of the term was introduced by the Schoolmen, and was highly approved by Mr. John Stuart Mill, who employed the word in no other sense in his "Logic."

Abstract nouns: The last of the five classes into which nouns may be divided, the others being (1) proper, singular, or meaningless nouns; (2) common, general, or significant nouns; (3) collective nouns; and (4) material nouns. Most abstract nouns are derived from adjectives, as *whiteness* from *white*, *height* from *high*, *roundness* from *round*; these are called *adjective abstract nouns*, or *adjective abs-*

tracts. Others come from verbs, as *creation* from *create*, and *tendency* from *tend*; these are denominated *verbal abstract nouns*, or *verbal abstracts*. Abstract nouns have properly no plural. When used in the plural this is an indication that they have lost their abstract character and gained a concrete meaning, so that they are now common or general nouns. (See Bain's *Higher Eng. Gram.*)

2. In a loose sense: Resulting from the mental faculty of abstraction, general as opposed to particular. The term is used even when the idea conceived of as separate from all others with which it is associated is not a quality. In this sense *reptile*, *star*, and *money* are abstract or general words, though none of the three is a quality. Locke did much to bring this looser sense of the word into currency. It is censured by John S. Mill (*Logic*, Bk. I., ch. ii., § 4).

"The mind makes the particular ideas received from particular objects to become general; which is done by considering them as they are in the mind, such appearances, separate from all other existences and the circumstances of real existence, as time, place, or any other concomitant ideas. This is called *abstraction*, whereby ideas taken from particular beings become general representatives of all of the same kind, and their names general names, applicable to whatever exists conformable to such *abstract ideas*."—*Locke: Human Understanding*, bk. ii., ch. xi., § 9.

† **Abstract science**: A term applied to mathematics.

"Another discriminates mathematical properties, and he addicts himself to *abstract science*."—*Isaac Taylor: Elements of Thought* (1846), p. 20.

Abstract or pure mathematics: Mathematics, which treats of number or quantity viewed as standing alone, as is done in geometry and arithmetic. It is contradistinguished from *mixed mathematics*, in which these are viewed as modified by the physical properties of the bodies in which they inhere. This is done in mechanics, hydrostatics, optics, &c.

Abstract numbers: Numbers considered in themselves without reference to any persons or things with which they may be conjoined. Thus *three* is an abstract number, but if conjoined with *men* it becomes concrete.

B. Used as a substantive:

1. *Logic*: An abstract name, as opposed to one which is concrete. [See CONCRETE.]

"Each of them [of the concrete terms] has or might have a corresponding abstract name to denote the attribute connoted by the concrete. Thus the concrete 'like' has its abstract 'likeness'; the concrete 'father' and 'son' have or might have the abstracts 'paternity' and 'filicity or filiation.'"—*Mill: Logic*, p. 45.

In the abstract, or (less frequently) in abstract, signifies in a state of separation, the looking at an idea apart from all other ideas with which it may be more or less intimately connected. It is opposed to in the concrete, which, however, is rarely used.

"Honest. So the old gentleman blushed, and said, Not *Honesty in the abstract*, but *Honest* is my name."—*Pilgrim's Progress*, pt. ii.

"The hearts of great princes, if they be considered, as it were, in *abstract*, without the necessity of states and circumstances of time."—*Sir H. Wotton*.

2. A summary, an epitome, a compendium of a book or document.

"Man, the *abstract* Of all perfection, which the workmanship Of Heaven hath modeled."—*Ford*.

"I have been urged to publish this *abstract*."—*Darwin: Orig. of Species* (1859), Introduction.

"Neither press, coffer, chest, trunk, well, vault, but he hath an *abstract* for the remembrance of such places, and goes to them by his note."—*Shakesp.: Merry Wives*, iv. 2.

¶ In *Shakespeare* (*Hamlet*, ii. 2), play-actors are called the "*abstract* [or in some copies the *abstracts*]" or brief chronicles of the time, perhaps because they acted history on a much smaller stage than that of the world, and in briefer time than the events which they reproduced really occupied.

Abstract of Title (Law): An epitome of the evidences of ownership. An abstract should show the soundness of a person's right to a given estate, together with any charges or circumstances in any wise affecting it. A perfect abstract discloses that the owner has both the legal and equitable estates at his own disposal perfectly unencumbered. The object of any abstract is to enable the purchaser or mortgagee, or his counsel, to judge of the evidence deducing and of the encumbrances affecting the title. (Wharton: *Law Lexicon*.)

* **Abstract of a Fine**. [FINE.]

* **Abstract of Pleas**: An epitome of the pleas used or to be used against the pleas of one's opponent.

* 4. An extract or a smaller quantity containing the essence of a larger.

"If you are false, these epithets are small; You're then the things, and *abstract* of them all."

Dryden: Aurungzebe, iv. 1.

"A man, who is the *abstract* of all faults That all men follow."

Shakesp.: Antony and Cleopatra, i. 4.

II. *Tech. (in Logic)*: A scholastic term employed when false conclusions are illogically deduced from the premises of the opponent. In this sense it is sometimes used in what are known as indirect demonstrations of propositions in geometry where the proposition is shown to be true, by proving that any supposition to the contrary would lead to an absurdity: as, "Because in the triangle C B D the side B C is equal to the side B D, the angle B D C is equal to the angle B C D; but B D C has been proved to be greater than the same B C D; therefore the angle B D C is at the same time equal to, and greater than the angle B C D, which is absurd." The term is borrowed from the Latin *absurdum* in the phrase "reductio ad absurdum" (q. v.). *Impossible*, however, is more frequently used in this way than *absurd*.

a-bŷss, s. [In Fr. *abime*; Ital. *abisso*; Lat. *abyssus*; Gr. *abyssos*=bottomless.]

¶ The English word *abyss* seems to have been but recently introduced into the language, for Jackson, in his *Commentaries on the Creed*, b. xi., c. 19, § 6, says, "This is a depth or *abyssus* which may not be dived into." (See Trench, *On some Deficiencies in our English Dictionaries*, p. 27.)

Essential meaning: That which is so deep as to be really bottomless, or to be frequently conceived of as if it were so.

Specially:

I. Lit.: A vast physical depth, chasm, or gulf: e. g., depth of the sea, primeval chaos, infinite space, Hades, hell, &c.

"Thou from the first
Wast present, and with mighty wings outspread,
Dove-like, sat'st brooding on the vast abyss."

Milton: *Par. Lost*, bk. i.

"Deep to the dark abyss might he descend,
Troy yet should flourish, and my sorrows end."

Pope: *Homer's Iliad*, bk. vi. 354-5.

II. Figuratively:

1. Infinite time, conceived of as if it were a bottomless depth.

"For sepulchres themselves must crumbling fall
In time's abyss, the common grave of all."

Dryden: *Juven*.

2. A vast intellectual depth.

3. A vast moral depth, e. g., sin; or emotional depth, e. g., sorrow.

"Acknowledging a grace in this,
A comfort in the dark abyss."

Wordsworth: *White Doe of Rylstone*, ii.

III. Technically:

Classic Archæol.: The temple of Proserpine. The reason why it was called the *abyss* was that it contained within it an immense quantity of gold and other precious material, some of it buried underground.

Her.: The center of an escutcheon. To bear a *fleur de lis* in *abyss* = to have it placed in the middle of the shield free from any other bearing.

Āb-ŷss-in'-i-anŷ, s. [In Arab. *Habashon* = Abyssinians, fr. *habasha* = to collect or congregate.]

1. The people of Abyssinia.

2. A sect of Christians consisting chiefly of the dominant race in the country from which the name is derived. The Monophysites, or those who believed that Christ possessed but one nature, are divided into two leading communions—the Copts

and the Abyssinians. The Abyssinians look up to the Alexandrian patriarch as their spiritual father, and allow him to nominate over them an ecclesiastical ruler called Abuna. [ABUNA.] The doctrines of the Abyssinians are the same as those of the Coptic church, but several peculiar rites are observed. The oldest churches are hewn out of the rock. Like the Greeks, the Abyssinians do not tolerate statues, but paintings are numerous.

*a-bŷss'-ūs. [ABYSS.]

*ab-ŷt, s. [An old spelling of HABIT.] Raiment, dress, apparel.

"In abyt maad with chastité and schame
Ye wommen schuld apparayl you."

Chaucer: *C. T.*, 5,924.

A. C., in *Chronology*, is ambiguous. It may stand (1) for *Ante Christum*=before Christ; or (2) for *Anno Christi*=in the year of Christ, i. e., in the year of the Christian era; or (3), for *After Christ*, as B. C. stands for *Before Christ*. It should not be used without an explanation of the sense in which it is to be taken.

*ac, conj. [A. S. *ac*.] But, and, also.

ac in composition.

A. As a prefix:

I. In Anglo-Saxon proper names. [A. S. *ac*, *aac*=an oak.] An oak, as *Acton*=oak town. In this sense it is sometimes varied, as *ak* or *ake* [AK.]

II. In words from the Latin:

a-cā'-cia, s. [In Ger. *akazie*; Fr., Lat., and Sp. *acacia*=(1) the acacia-tree, (2) the gum; Gr. *akakia*, fr. *akē*=a point or edge.]

†1. The *Acacia vera*, or true acacia of the ancients; probably the *Acacia Nilotica*, the Branch of Acacia Arabica. Egyptian thorn.

2. Bot.: A genus of plants belonging to the Mimosæ, one of the leading divisions of the great Leguminous order of plants. They abound in Australia, in India, in Africa, tropical America, and generally in the hotter regions of the world. Nearly 300 species are known from Australia alone. They are easily cultivated in greenhouses, where they flower for the most part in winter or early spring. The type is perhaps the *Acacia Arabica*, or gum-arabic tree, common in India and Arabia. It looks very beautiful with its graceful doubly pinnate leaves, and its heads of flowers like little velvety pellets of bright gamboge hue. It is the species referred to by Moore:

(a) Literally:

"Our rocks are rough, but smiling there
Th' acacia waves her yellow hair,
Lonely and sweet, nor loved the less
For flowering in a wilderness."

Moore: *Lalla Rookh* (*Light of the Haram*).

(b) Figuratively:

"Then come—thy Arab maid will be
The loved and lone acacia-tree."—*Ibid*.

Other species than the *A. Arabica* produce gum-arabic. That of the shops is mostly derived from the *A. vera*, a stunted species growing in the Atlas mountains and other parts of Africa. [GUM.] *A. Vereke* and *A. Adansonii* yield gum Senegal. [GUM.] *A. Catechu* furnishes catechu. [CATECHU.] Other species contain tannin, and are used in tanning. Others yield excellent timber. The pods of *A. concinna* are used in India for washing the head, and its acid leaves are employed in cookery. The bark of *A. Arabica* is a powerful tonic; that of *A. ferruginea* and *A. leucophæa*, with jagghery water super-added, yields an intoxicating liquor. The fragrant flowers of *A. Farnesiana*, when distilled, produce a delicious perfume.

3. The *Robinia pseudo-Acacia*: A papilionaceous tree, with unequally pinnate leaves, found in North America, where it is called the Locust-tree.

4. Phar.: (1) The inspissated juice of the unripe fruit of the *Mimosa Nilotica*. It is brought from Egypt in roundish masses wrapped up in thin bladders. The people of that country use it in spitting of blood, in quinsy, and in weakness of the eyes. (2) Gum arabic. (3) *German acacia*: The juice of unripe sloes inspissated. (4) *Acaciæ flores*: The blossoms of the sloe.

2. A sect which derived its name from Acacius, Patriarch of Constantinople from A. D. 471 to A. D. 488. He acted in a conciliatory way to the Monophysites, and was in consequence deemed a heretic by the Roman Pontiff and the Western church, who ultimately succeeded in obtaining the erasure of his name from the sacred registers.

The *Academic Philosophy* was that taught by Plato in the "Academy" at Athens. [ACADEMY.] It was idealist as opposed to realist, materialist, or sensationalist. Plato believed in an intelligent First Cause, the author of spiritual being and of the material world, to whom he ascribed every perfection. He greatly commended virtue, and held the pre-existence and the immortality of the immaterial part of our nature. No ancient philosophy so readily blended with Christianity as that of Plato.

1. The academy where Plato taught.
2. Any academy of the modern type.

Of *Academus*—is this false or true?"

2. *Modern*: e. g., the Royal Military Academy at Woolwich. Sometimes used also for a private school.

III. A society or an association of artists linked together for the promotion of art, or of scientific men similarly united for the advancement of science, or of persons united for any more or less analogous object. Thus the French possess the celebrated Academy or Institute, established by Cardinal Richelieu in 1635, for fixing and polishing the French language. The use of the word *academy*, different from the ancient one, is believed to have arisen first in Italy at the revival of letters in the fifteenth century. The nearest approach to these institutions in America is the Smithsonian Institute in Washington.

IV. The building where the pupils of a high school meet, or where such an association for the promotion of science and art as those just mentioned is held: e. g., "the *Academy*, which was one of the ornaments of the town, caught fire, and was in danger of being burnt down."

ăc-ăl'-ĕph-æ, or ăc-ă-lĕ-phæ, s. pl. [Gr. *akalēphē*=a nettle; so called from the property some of them have of imparting, when touched, a sensation like the sting of a nettle.] The third class of the Radiata, Cuvier's fourth sub-kingdom of animals. They were defined as zoophytes which swim in the sea, and in the organization of which some vessels are perceived which are most frequently only productions of the intestines, hollowed in the parenchyma of the body.

They were divided into *Acalephæ simplices* and *A. hydrostaticæ*: the first contained the genera *Medusa*, *Æquorea*, &c.; and the latter, *Physalia*, *Diphyes*, and others. They are now combined with the hydroid polypes to form the class Hydrozoa. They fall under Huxley's Siphonophora, Discophora, and probably a third as yet unnamed order, to contain the animals called by Haeckel *Trachymedusæ*. Of *Acalephæ* may be mentioned the genus *Medusa*, of which the species on our coasts are called "jelly-fish," from their jelly-like aspect; and the *Physalia*, or Portuguese man-of-war, which is common in more southern latitudes.

1. *Natural Philosophy*:

The rate of increase of velocity per unit of time. The C. G. S. unit of acceleration is the acceleration of a body whose velocity increases in every second by the C. G. S. unit of velocity—viz., by a centimetre per second. (Everett. *C. G. S. System of Units* (1875), ch. iii., p. 211.)

The unit of *acceleration*: That acceleration with which a unit of velocity would be gained in a unit of time. (Everett.) It varies directly as the unit of length, and inversely as the square of the unit of time. The numerical value of a given acceleration varies inversely as the unit of length, and directly as the square of the unit of time. (*Ibid.*, ch. i., pp. 2, 3.)

"If T stands for time, then *angular acceleration* is $\frac{1}{T^2}$." (*Ibid.*) "If L stands for length, and T for time, then *acceleration* is $\frac{L}{T^2}$." (*Ibid.*)

2. *Astronomy*:

The *secular acceleration* of the moon's mean motion: An increase of about eleven seconds per century in the rapidity of the moon's mean motion. It was discovered by Halley and explained by Laplace.

Acceleration of the fixed stars: The measure of the time by which a fixed star daily gains on the sun on passing the meridian. A star passes the meridian 3 min. 55.9 sec. earlier each day; not that the star's motion is really accelerated—it is that the sun's progress is retarded, as in addition to his apparent diurnal motion through the heavens, he is also making way to the east at the rate of 59 min. 8.2 sec. a day.

Acceleration of a planet: The increased velocity with which it advances from the perigee to the apogee of its orbit.

3. *Hydrology*:

Acceleration of the tides: The amount by which from certain causes high or low water occurs before its calculated time.

4. *Phys. & Path.*: The extent to which in certain circumstances the circulating fluid and other parts of the system gain increased activity.

*I. Primarily, it signified the same as the Greek *prosōlia*, viz., a musical intonation used by the Greeks in reading and speaking.

II. Now (in general language):

1. The laying of particular stress upon a certain syllable or certain syllables in a word; or an inflection of the voice which gives to each syllable of a word its due pitch with respect to its height or lowness. In a dissyllable there is but one accent, as *a-back*, but in a polysyllable there are more than one. In *transubstantiation* there are properly three—*tran'-sub-stan'-ti-a'-tion*. One of these, however—that on the fifth syllable, the *a* just before *-tion*—is greater than the rest, and is called the *primary accent*; the others are called *secondary*. There is a certain analogy between accent and emphasis, emphasis doing for whole words or clauses of sentences what accent does for single syllables.

2. Peculiar intonation of speech; as, French accent, foreign accent.

3. Certain diacritical marks borrowed from the Greeks, and designed to regulate the force of the voice in pronunciation or for other uses. They are three in number: the *acute* accent (´), designed to note that the voice should be raised; the *grave* accent (`), that it should be depressed; and the *circumflex* (˘ or ˆ), which properly combines the characters of the two accents already named, that the voice should be first raised and then depressed. The acute and grave accents are much used in French, but to discriminate sounds, as *élite*, *crème*; and the circumflex of the form ˆ is frequently employed in Latin to discriminate the ablative of the first declension, as *pennā*, from the nominative *penna*.

Accents and other diacritical marks occur also in English. Sometimes the former are employed to regulate the stress of the voice; sometimes, again, they are employed for other purposes.

Specially:

(a) *Geom. & Alg.*: Letters, whether capital or small, are at times accented, particularly when there is a certain relation between the magnitudes or quantities which they represent. Thus, for example, the line A B may be compared with the line A' B', and the quantity *xy* with *x' y'*.

fāte, fāt, fāre, amidst, whāt, fāll, father; wē, wēt, hēre, camēl, hēr, thēre; pīne, pīt, sīre, sīr, marīne; gō, pōt, or, wōre, wōlf, wōrk, whō, sōn; mūte, cūb, cūre, unite, cūr, rāle, fūll; trȳ, Sȳrian. æ, œ = ē; ey = ā. qu = kw.

(b) *Trig.*: Accents mark minutes and seconds of a degree: *e. g.*, 30° 16' 37".

(c) *Hor.*: Accents are sometimes used to denote minutes and seconds of an hour: *e. g.*, 6 h. 7' 14".

(d) *Engineering*: Feet and inches, and similar measures of length, are often noted by accents: thus, 3' 10" = 3 feet 10 inches.

3. Mode of speaking or pronunciation, with special reference to dialectic peculiarities.

"The broadest accent of his province."—*Macaulay: Hist. Eng.*, ch. iii.

¶ *Poetry*: Sometimes used for the language of a nation or race.

"How many ages hence
Shall this our lofty scene be acted o'er
In states unborn and accents yet unknown."
Shakesp.: Jul. Caesar, iii. 1.

4. Sometimes without reference to dialectic peculiarities.

"Accent is a kind of chaunting; all men have accent of their own, though they only notice that of others."—*Carlyle: Heroes and Hero-Worship*, Lect. iii.

5. In the plural: Words. Chiefly in poetry, but also in prose.

"But when he speaks, what elocution flows!
Soft as the fleeces of descending snows,
The copious accents fall with easy art;
Melting they fall, and sink into the heart!"
Pope: Homer's Iliad, bk. iii. 283–286.

"... the last accents of the darling of the people."—*Macaulay: Hist. Eng.*, ch. v.

¶ In *Poetry*: Sometimes specially a vocal accompaniment to instrumental music.

"Not by chords alone
Well touch'd, but by resistless accents more."
Cowper: Transl. of Milton's Lat. Poem to his Father.

6. *Mod. Music*: The strain which recurs at regular intervals of time. Its position is indicated by upright strokes called *bars*. The first note inside a bar is always accented. When the bars contain more than one group of notes, which happens in compound time, other accents of lesser force occur on the first note of each group: these are called *secondary* or *subordinate* accents, whilst that just inside the bar is termed the *primary* or *principal* accent. Other accents can be produced at any point by the use of the sign > or *sf*. The throwing of the accent on a normally unaccented portion of the bar is called *syncopation*. A proper grouping of accents will produce rhythm. It is considered a fault if an accented musical note falls on a short syllable. (*Stainer and Barrett: Dictionary of Musical Terms*.)

The hedge, or English, sparrow was recently introduced into this country in the hope that the chinch-bug would be destroyed. But the feathered foreigner proved such an intolerable nuisance to the American farmer, that a price is now set on his head.

A. Of persons:

Law: One who is not the chief actor in an offense nor present at its commission, but still is connected with it in some other way. Accessories may become so *before the fact* or *after the fact*. Sir Matthew Hale defines an *accessory before the fact* as one who, being absent at the time of the crime committed, doth yet procure, counsel, or command another to commit a crime. If the procurer be present when the evil deed is being done, he is not an accessory, but a principal. An *accessory after the fact* is one who, knowing a felony to have been committed, receives, relieves, comforts, and assists the felon. In high treason of a pronounced character there are no accessories, all are principals. In petit treason, murder, and felonies, there may be accessories; except only in those offenses which, by judgment of law, are sudden and unpremeditated, as manslaughter and the like, which, therefore, cannot have any accessories before the fact. So, too, in petit larceny, and in all crimes under the degree of felony, there are no accessories either *before* or *after the fact*; but all persons concerned therein, if guilty at all, are principals. (*Blackstone: Commentaries*, bk. iv., chap. iii.)

After communicating there with the ninth and tenth pairs they pass out close to the eighth, and terminate finally in the trapezius.

"The eighth pair [of nerves, according to Willan's arrangement] including the glosso-pharyngeal, the pneumo-gastric, and the spinal *accessory*."—*Todd & Bowman: Physiol. Anat.*, vol. ii., ch. xi.

3. Zool. Accessory cusps (in teeth): Those super-added to the more normal ones, and contributing to their efficiency.

"The tooth of the fossil in question differs in the shape of the middle and in the size of the *accessory cusps*."—*Owen: British Fossil Mammals* (1846), p. 72.

Accessory valves (in the shells of the molluscan genera *Pholas*, *Pholididia*, and *Xylophaga*): Small valves additional to the two large ones naturally occurring in those "bivalve" shells. They protect their dorsal margins. They are well seen in the common *Pholas dactylus*.

4. Painting: Pertaining to the unessential parts of a picture, introduced either for the purpose of illustrating the main subject, or for ornament's sake.

5. Scots Law:

(a) *Accessory actions* are those which are subservient to others, or designed to prepare the way for them: as, for instance, an action for the recovery of lost deeds.

(b) An *accessory obligation* is an obligation arising from another one which is antecedent and primary to it. Thus, when one borrows money at interest, the repayment of the principal is the primary, and the regular liquidation of the interest the accessory obligation.

ăc'-cēs'-sūs, [Lat. *accessus*.] A term in canon law, signifying a method of voting at the election of a pope, generally known as an election by acclamation.

ac-ci-a-ca-tŭ-ra (*ci* as *chi*), *s.* [Ital., from *acciaccare* = to bruise, to crush, to jam down.]

Music: The procedure of an organist when, in place of touching a single note, he also momentarily allows his finger to come in contact with the semitone below.

ăc'-cŭ-dēnce, *s.* [Lat. *accidentia* = a casual event.] An elementary book of grammar, especially of Latin grammar.

"Mrs. Page, Sir Hugh, my husband, says, my son profits nothing in the world at his book; I pray you, ask him some questions in his *accidence*."—*Shakesp.: Merry Wives*, iv. 1.

ăc'-cŭ-dēns, *s.* [Lat. *accidens*, pr. par. of *acido*; also *s.*] The opposite of essence or substance [ACCIDENT, No. II.]

"*Accidens*, on the contrary, has no connexion whatever with the essence, but may come and go, and the species still remain what it was before."—*J. S. Mill: Logic*.

ăc'-cŭ-dēnt, *s.* [In Fr. *accident*; Ital. *accidente*; Lat. *accidens*, pr. par. of *acido* = to fall to, to arrive suddenly, to happen: *ad* = to; *cado* = to fall.] [CASE, CADENCE.]

I. Of occurrences:

1. *Gen.*: An occurrence or event of whatever kind.

"And ye choice spirits, that admonish me,
And give me signs of future accidents! (Thunder.)"
Shakesp.: *King Henry VI.*, Part I., v. 3.

2. *Specially*:

(a) Something unpurposed or unintentional, an occurrence not planned beforehand by man.

"Ant. Do it at once;
Or thy precedent services are all
But accidents unpurposed."
Shakesp.: *Antony and Cleopatra*, iv. 12.

"And more by accident than choice,
I listened to that single voice."
Longfellow: *Golden Legend*, iv.

(b) An unforeseen occurrence, particularly if it be of a calamitous character. This is the most common use of the word.

"An unhappy accident, he told them, had forced him to make to them in writing a communication which he would gladly have made from the throne."—Macaulay: *Hist. Eng.*, ch. xxv.

"The old ones seem generally to die from accidents, as from falling down precipices."—Darwin: *Voyage round the World*.

(c) The state of a betrayed girl.

II. Of unessentials:

1. *Logic*:

(a) Whatever does not really constitute an essential part of a person or thing; as the clothes one wears, the saddle on a horse, &c.

(b) The qualities or attributes of a person or thing, as opposed to the substance. Thus *bitterness*, *hardness*, &c., are attributes, and not part of the substance in which they inhere.

(c) That which may be absent from anything, leaving its essence still unimpaired. Thus a rose might be white without its ceasing to be a rose, because color in the flowers of that genus is not essential to their character.

¶ *Accidents*, in *Logic*, are of two kinds—separable and inseparable. If walking be the accident of a particular man, it is a separable one, for he would not cease to be that man though he stood still; while on the contrary, if Spaniard is the accident connected with him, it is an inseparable one, since he never can cease to be, ethnologically considered, what he was born. (Whately: *Logic*, bk. ii., chap. v., § 4.)

¶ From logic these significations have found their way into ordinary English literature.

"And torne substance into accident."
Chaucer: *Parsones Tale*, 13,954.

"The accident of his birth . . . had placed him in a post for which he was altogether unfitted."—Macaulay: *Hist. Eng.*, ch. v.

2. *Gram.*: A property attached to a word which nevertheless does not enter into its essential definition. Each species of word has its accidents: thus those of the noun substantive are gender, declension, and number. Comparison in an adjective is also an accident.

"Unto grammar also belongeth, as an appendix, the consideration of the accidents of words, which are measure, sound, and elevation or accent, and the sweetness and harshness of them."—Bacon: *Advanc. of Learning*, bk. ii.

3. *Her.*: An additional note or mark on a coat of armor, which may be omitted or retained without altering its essential character.

†*Med.*: A symptom of a disease. (*Rider.*)

ăc-ċi-dēnt'-al, a. [Fr. *accidentel*.]

1. Occurring suddenly, unexpectedly, and from a cause not immediately discoverable, or, as some of the unphilosophic and irreligious believe, "by chance."

"So shall you hear
Of accidental judgments, casual slaughters."
Shakesp.: *Hamlet*, v. 2.

*2. Adventitious; produced not from the natural qualities of the agent or agency left to itself, but by the influence of something foreign to it.

"By such a minister as wind to fire,
That adds an accidental fierceness to
Its natural fury."—Denham: *Sophy*.

3. Not essential to, which might be dispensed with, and yet leave the thing to which it pertains, or in which it inheres, unimpaired.

"He determined that all the species occurring in this marl, twelve in number, agreed in every respect, even in their accidental variations, with the same species now existing in Yorkshire."—Owen: *British Fossil Mam. & Birds*, p. 168.

¶ *Specially*:

(a) In *Logic*, an accidental definition is one which assigns the properties of a species or the "acci-

dents" of an individual. Besides *accidental*, there are also physical and logical definitions. (Whately: *Logic*.)

(b) *Persp.*: An *accidental point* is the point in which a straight line drawn from the eye parallel to another given straight line intersects the plane of the picture. Thus, in the accompanying figure, A B is the line parallel to C D, the line given in perspective. A B cuts the plane B F in the point B. B is the accidental point.

(c) *Music*: *Accidental* is the term used respecting such sharps, flats and naturals as do not occur at the clef, and which imply a change of key, or modulation different from that in which the piece began. For instance, in the key of C natural major, an accidental sharp prefixed to F implies the key of G major, and a flat placed before B implies the key of F major or D minor.

(d) *Optics*: *Accidental colors*, called also *ocular spectra*, are those which are produced by a weakness in the eye, and which are not essential to the light itself. If a person look intensely with one eye at a colored wafer affixed to a sheet of white paper, and then turn that same eye on another part of the paper, a spot like the wafer will appear, but of a different color. If the wafer was red, the spot will be green; if the former was black, the latter will be white; and there will be corresponding transformations whatever the color.

(e) *Painting*. *Accidental lights*: Secondary lights; effects of light other than ordinary daylight. (*Fairholt*.)

ăc-ċi-dēnt'-al, s. [From the adjective.]

1. *Logic and Ord. Lang.*: A property which is not essential; that is, one which may be dispensed with without greatly altering the character of that of which it is a property.

¶ Often in the plural.

"Conceive as much as you can of the essentials of any subject before you consider its accidents."—Watts: *Logic*.

"This similitude consisteth partly in essentials, or the likeness of nature; partly in accidents, or the likeness in figure or affections."—Pearson: *The Creed*, Art. I.

2. *Painting* (plural): Those fortuitous effects produced by light falling upon particular objects, so that portions of them stand forth in abnormal brightness, and other portions are cast into the shadow and greatly darkened.

2. Not essentially.

acetic acid, s. The acid which imparts sourness to vinegar, vinegar being simply acetic acid diluted, tinged with color, and slightly mingled with other impurities. The formula of acetic acid is

= methyl-formic acid. It is formed by the acetous fermentation of alcohol. [FERMENTATION.] Acetic acid is a monatomic monobasic acid. Its salts are called acetates. A molecule of acetic acid can also unite with normal acetates like water of crystallization. Its principal salts are those of potassium, sodium, and ammonium, a solution of which is called Spiritus Mindereri. The acetates of barium and

calcium are very soluble. Aluminum acetate is used in dyeing. Lead acetate is called sugar of lead from its sweet taste. It dissolves in 1½ parts of cold water; it also dissolves oxide of lead, forming a basic acetate of lead. Basic cupric acetate is called verdigris. Acetic acid below 15° forms colorless transparent crystals (glacial acetic acid), which melt into a thin, colorless pungent, strongly acid liquid, soluble in alcohol, ether, and water. It boils at 118°. Its vapor is inflammable.

Pyroligneous acid is impure acetic acid, formed by the destructive distillation at red heat of dry hard wood, as oak and beech.

¶ Acetylene gas is now commercially produced for illuminating purposes by subjecting calcium carbide (CaC_2) to the action of water. Some manufacturers reduce the gas to a liquid, and in that form supply it to consumers.

acetylene lamp, s. A lamp designed for utilizing acetylene as an illuminant. Acetylene lamps have recently come into general use among cyclists. The acetylene used in these lamps is generated by water dropping upon calcium carbide (q. v.), the gas given off going to the burner and slacking the lime remaining behind. In some of the lamps, cartridges filled with calcium carbide are used, and the dropping of the water into the cartridge is regulated by an adjustable valve. The acetylene flame is very brilliant, and much more difficult to extinguish by force of wind, or shock, than an oil flame. These properties render it very valuable as a bicycle illuminant.

¶ Mr. H. T. Riley, editor of the *Munimenta Gildhallæ Londinensis*, says, in his preface, p. xviii., that in the fourteenth and the beginning of the fifteenth centuries the more educated classes use the French word *achat*, probably pronounced by the English *acat*, to designate buying or selling at a profit. This "*achat*" was the source of Whittington's wealth. When the term had gone into disuse, and its meaning had become forgotten, some inventive genius, not understanding it, devised the story of "Whittington and his Cat." 1. *Achromatic Telescope*: The name given by Dr. Bevis to an improved form of the refracting telescope constructed by Dollond in 1761. When a single lens is used for the object-glass of a telescope, the image of the object is fringed with color, and hence high magnifying powers cannot be used, unless the focal length of the lens is very considerable. Sir Isaac Newton, from experiments made on the refrangibility of light, had erroneously concluded that the size of the object-glasses of refracting telescopes could not be enlarged beyond three or four inches [APERTURE]: for this reason he turned his attention to reflected light, in which the image of the object is uncolored. Reflecting telescopes of the Gregorian form were from Newton's time generally used. In the middle of the last century, Dollond, a Spitalfields weaver, undertook a course of experiments with the object of ascertaining the correctness of Newton's statements. His researches were rewarded by the valuable discovery that by using two different kinds of glass, and giving to the surfaces of each lens a different curvature—the focal lengths of the two lenses being in a certain ratio—an image of the object could be obtained free from color; while, by a skillful arrangement of the radii of the surfaces of each glass, the errors arising from spherical aberration [ABERRATION] could be entirely removed. In the early telescopes made by Dollond and his son Peter, the object-glass was usually a double concave lens of flint enclosed between two convex glasses of crown

(Fig. 1); but modern object-glasses have only a concave lens of flint combined with a convex of crown or plate (Fig. 2). A century ago flint-glass of a size suitable for large telescopes could not be obtained; but more recently the removal of the excise duty, and the success attained by Guinand and others in glass manufacture, has enabled English and foreign opticians to construct achromatic telescopes of considerable magnitude, with object-glasses of twelve, fifteen, and even twenty-six inches diameter, the area of aperture having the property of increasing in a considerable ratio the power of the telescope to penetrate into space and render visible the minutest objects. Achromatic telescopes, from their convenient size and comparative cheapness, have been and still are generally used by astronomers in Great Britain, Europe, and America, and by their aid many modern discoveries have been made. So perfect is the image formed by a well-corrected achromatic object-glass, that almost any magnifying power can be applied; and thus a telescope of this form three or four feet in length is superior in its definition and surpasses in magnifying power one of the old unwieldy telescopes 100 feet long. The eye-glasses of the telescope also require to

be free from color and aberration, and the correction of these defects is accomplished by an arrangement of the lenses forming the eye-piece. [See EYE-PIECE, OBJECT-GLASS, APLANATIC.]

2. *Achromatic Microscope*: In a compound microscope an image of the object is first formed by the objective, and afterward enlarged by the lenses constituting the eye-piece. Till about the year 1830 the object-glasses of microscopes were mostly formed of single or combined lenses, the apertures of which, in order to obtain a distinct image of the object, were exceedingly small. The labors of modern opticians to adapt the achromatic principle to compound microscopes were rewarded by the construction of lenses in which the images of objects were rendered distinct in their minute details even when high magnifying powers were applied. In a modern microscopic objective, not only is the color corrected and the image free from distortion, but by an increase in the angle of aperture [ANGLE OF APERTURE] the penetrating power of the objective is considerably increased, and less magnifying power is required from the eye-piece. With a good objective of one-eighth of an inch focus, magnifying powers ranging from 450 to 1,200 diameters can be obtained by using different eye-pieces. [OBJECTIVE.]

II. *As substantive*:

1. *Chem.*: A salt of hydrogen in which the hydrogen can be replaced by a metal, or can, with a basic metallic oxide, form a salt of that metal and water. Acid oxides of the same element are distinguished by the termination of *-ous* and *-ic*—as sulphurous and sulphuric—the latter containing the most oxygen; they are also called anhydrides. They unite with water and form acids having the same terminations. By replacement of the hydrogen by a metal they form salts distinguished by the terminations *-ite* and *-ate* respectively. These acids are called oxygen acids; formerly it was thought that all acids contained oxygen, this element being regarded as the acidifying principle (generating acid). But many acids are formed by direct union of hydrogen with an element, as hydrochloric acid (HCl), hydrosulphuric acid (H₂S), or with an organic radical, as hydrocyanic acid, H(CN). Acids which are soluble in water redden blue litmus, and have a sour taste. Acids are said to be monobasic, dibasic, tribasic, &c., according as one, two, or three atoms of hydrogen can be replaced by a metal. Organic acids can be produced by the oxidation of an alcohol or aldehyde. They contain the monad radical (HO·OC), once if they are monobasic, twice if dibasic, &c. They are also classed as monatomic, diatomic, &c., according as they are derived from a monatomic or diatomic alcohol, &c. Acids derived from a diatomic alcohol can be alcohol acids or aldehyde acids. [See GLYCOL.] Many organic acids occur in the juices of vegetables, some in animals, as formic acid in ants.

2. *Min.*: In W. Phillips' arrangement of minerals, acids constitute his third class. He arranges under it sulphuric acid and boracic acid, both of which occur native.

Under the fourth class above-named were ranked such minerals as calc spar, gypsum, boracite, witherite, heavy spar, strontianite, &c.; under his fifth class were ranked nitre, natron, borax, sal-ammoniac, &c.; and under his sixth, alum, cryolite and glauberite. Minerals are now arranged on another principle. [MINERALOGY.]

The former method is carried out by ascertaining the measured quantity of a standard alkaline solution required to saturate a given volume of the acid. That by weight analysis can be effected in more ways than one. A convenient one is to decompose a known weight of the acid with an excess of acid carbonate of sodium or potassium, and estimate by weight the quantity of carbonic anhydride evolved. When this is done the quantity of real acid can without difficulty be ascertained. (*Watts: Chemistry.*)

ăc-ōn-ite, *s.* [Lat. *aconitum* (q. v.).]

1. A name of the common Blue Monk's-hood (*Aconitum napellus*). It occurs wild in Carinthia and Carniola, and, having long been cultivated in British gardens, has escaped and become naturalized in England. It is a very poisonous plant, the root being especially dangerous. When the leaves and flowers have died away, the root, or root stock, has sometimes been mistaken for that of horse-radish, and has been eaten with fatal results. The root is of tapering form, and when old is dark brown outside and white inside, whilst the young ones are much paler. Its taste is bitter at first, after which there is a numbness and tingling of the lips and tongue. The root-stock of the horse-radish (*Cochlearia amaracea*) is much larger than that of the aconite, and does not taper. Externally it is of a dirty yellow color, and marked at the top by transverse scars, left behind by the leaves. Its taste is at first acrid or pungent, not bitter. [ACONITUM.]

2. Less properly (among some gardeners and popularly): The *Eranthis nivalis*, a plant of the order Ranunculaceae, the same one as that to which the proper aconite belongs.

¶ *Winter-aconite*=*Eranthis nivalis*. [See *ACONITE*, 2.]

Formula $C_6H_5O_6 = (C_6H_3O_3)'''(OH)_3$. Its salts are called aconitates.

ăc-ōn-it-i-nā, **ăc-ōn-it-ine**, *s.* [In Ger. *aconitin*.] An alkaloid substance existing in *Aconitum napellus* and some of its congeners. Formula $C_{30}H_{47}NO_7$. A white substance slightly soluble in cold, soluble in fifty parts boiling water, very soluble in ether. It melts at 80°. It is in-

tensely poisonous. It is given internally in very small doses in severe neuralgia and rheumatism, and also forms a valuable liniment.

ăc-ōn-i-tūm, *s.* [In Fr. *aconit*; Sp., Port., & Ital. *aconito*, fr. Lat. *aconitum*; Gr. *akoniton*=a poisonous plant growing on sharp steep rocks *en akonais*, or in a place called *Akonai*, in Bithynia, or from *akōn*=a dart, from its having long ago been used to poison darts with.]

1. *Bot.*: Wolf's-bane, a genus of plants belonging to the order Ranunculaceae, or Crowfoots. The species are generally from three to six feet high, with digitate and palmate leaves, and terminal spikes of blue or yellow flowers. The best known is the Monk's-hood (*A. napellus*). [ACONITE.] The Indian *A. ferox*, supposed to be only a variety of the former, is a more virulent poison than it, being acrid in a high degree. *A. napellus* and *cammarrum* are emetic.

2. *Ord. Eng.*: Before the word *aconite* was naturalized in the language, *aconitum* was the term employed.

It does so not from two fixed points—the plumule and the radicle—but indifferently from any portion of the surface, a character which the Acotyledons share with some Aroidæ. [See ACROGENS, CRYPTOGRAMMA.] The old class of Acotyledons has been divided by Lindley into two—the *Thallogens*, containing the Algal, Fungal, and Lichenall alliances; and the *Acrogens*, including the Muscal, Lycopodal, and Filical alliances. a-cōus'-tīcs, or **a-cōus'-tīcs**, s. [In Fr. *acoustique*.] [ACOUSTIC.] A term introduced by Saver. The science which treats of sounds, or, more specifically, that branch of natural philosophy which treats of the nature of sound and the laws of its production and propagation, as far as these depend on physical principles. Sound is produced by the vibration of the particles in a sonorous body, evoked by a blow or in some other way. If a number of small, light wooden balls be suspended by silk threads over a bell-jar, just in contact with the widest part of the glass, the drawing of a violin-bow across the edge of the glass will impart to the particles of the latter a vibratory movement, which will make itself visible by flinging off the balls oftener than once. Sound requires an elastic medium for its transmission to the tympanum of the ear. *In vacuo* it becomes inaudible, but brought in contact with air it is heard without difficulty. Its rate of progress through dry air, at a temperature of 32°, is, according to Van der Kolk, 1,091 feet 8 inches in a second; and according to Mr. Stone, 1,090'6 feet; through metallic rods its motion is much more rapid.

Two particles which are in the same state of vibration—i. e., are equally displaced from the positions which they occupied in *equilibrium*, and are moving in the same direction, and with equal velocities—are said to be in the same phase; whilst those which are proceeding in a contrary direction are said to be in opposite phases.

If the vibration of particles takes place in the same direction as that in which the disturbance is moving from particle to particle, it is called *longitudinal*; if at right angles to it, *transverse*.

So analogous are the sound-producing vibrations of particles to those of waves in the ocean that the terms *waves* and *undulations* are used in Acoustics as well as in Hydrology. The distance which separates two particles in the same phase is called the *length of a wave*. As in Optics, so in Acoustics, there are *refraction* and *reflection*, the laws in both cases being the same.

Refraction of sound: The change of direction which is produced when a wave of sound, traveling through one medium, meets a second one not of the same kind, and excites in it a wave of a different velocity and direction from the first.

Reflection of sound: The change of direction which is produced when a wave of sound, traveling through one medium, meets a second one diverse from the first, and in addition to transmitting to it a refracted wave, excites in it an undulation traveling in a different direction, but with the same velocity as the other. A sound may be frequently repeated, as from an echo-producing cliff, and in a whispering gallery or a tunnel.

Two or more sonorous waves traveling through the same medium, and acting on the same particles, are said mutually to *interfere* with each other. If they move toward such an interference from exactly opposite directions, they produce between them a *stationary wave*. This expression does not imply that every particle of the wave thus produced is motionless. Some particles are so, whilst others vibrate longitudinally or transversely. The points at which the particles are stationary are called *nodes*, and the vibratory portions *ventral segments*. A vibrating musical string, a tuning-fork, or other stiff rod vibrating longitudinally, make stationary waves. These are generated also inside wind-

instruments when the latter are blown. The vibrations of a solid are best communicated to another solid: hence a tuning-fork being struck is applied to a table, and violin-strings are placed in contact with a hollow wooden box, which imparts to their sound a greater intensity than if its transmission to the ear were entrusted to the air alone.

Noise is a single blow given to the ear, whilst music is caused by a series of feeble blows following one another at regular intervals. [MUSIC, HARMONY, SOUND.]

¶ Some writers have divided Acoustics into *Dia-coustics*, which treats of those sounds which pass directly from the sonorous body to the ear; and *Catacoustics*, which investigates the phenomena of reflected sounds. Another division is into *Acoustics proper*, or the science of hearing, and *Phonetics*, or the science of sound; the latter word being from Gr. *phōnē*=sound.

The Imperial acre contains 4,840 square yards, the Scottish one 6,104,12789 square yards, and the Irish one 7,840 square yards. The imperial acre is current in the United States. The old Roman *jugerum*, generally translated "acre," was about five-eighths of the imperial acre.

1. *Zoology*:

1. A term introduced by Mr. Macleay, the founder of the now extinct circular or quinary school of zoologists, and used by him to designate those animals in which, as he believed, the nervous system was confusedly blended with the other tissues, or, in other words, that in which nervous molecules dispersed over, or, as it were, confounded with the substance of those gelatinous animals, impregnated their whole structure with sensibility. He included under the *Acrita* the following five classes: (1) *Polypi vaginati*; (2) *Polypi natantes*; (3) *Intestina*; (4) *Agastria*, or *Infusoria*; and (5) *Polypi rudes*. These five classes he believed to constitute a circle.

2. In 1835, Professor Owen, English anatomist, proposed to use the word in a more restricted sense for animals whose nervous system is obscure. His *Acrita* do not figure as a sub-kingdom of animals,

but constitute a series of the Radiated sub-kingdom running parallel to another series, thus:

NEMATONEURA. ACRITA.

Echinodermata (*Cuvier*). Acalephia (*Cuvier*)

Class Polypi (*Cuvier*).

The former was, of course, the more abstruse, and more rigorously established than the merely popular exoteric teaching. [ACROAMATIC.]

ăc-rōg'-ēn-oŭs, a. [ACROGEN.]

Gen.: Growing at the top.

Spec.: Pertaining to the flowerless plants called *Acrogens*. When applied to fungi it signifies = attached to the tips of threads.

ăc-rōg'-ēnŷ (Eng.), ăc-rōg'-ēn-æ (Latinized Greek), s. pl. [Gr. *akron* = a point or top, and *gennaō* = to engender, to bring forth; (*lit.*) top-growers or point-growers.] Plants of which the growth takes place at the extremity of the axis. The word was formerly used in a wider sense than now.

1. Formerly it included all flowerless plants—Linnaeus' *Cryptogamia*. The term, however, referred not to the absence of flowers, or to the obscure character of the fructification, but to the growth of the stem. All plants were divided into *Exogens*, or those growing around the circumference of the trunk, just within the bark; *Endogens*, or those growing inside, that is, along the central axis; and *Acrogens*, or those increasing at the extremity of the stem. In Lindley's *Natural System of Botany*, 2d edit. (1836), the *Acrogens*, used in this extensive sense, constitute the fifth class of the Vegetable Kingdom, the other four being *Exogens*, *Gymnosperms*, *Endogens* and *Rhizanthos*. They are made to contain five alliances: 1, *Filicales* (Ferns); 2, *Lycopodales* (Club-mosses); 3, *Muscales* (Mosses); 4, *Charales* (Charas); and 5, *Fungales* (Mushrooms, Lichens, and Algae).

2. The meaning is now more restricted. In Lindley's *Vegetable Kingdom* (1846) the flowerless plants compose not one, but two classes: (1) *Thallogens* and (2) *Acrogens*. The former are the lower in organization. The latter compose three alliances—*Muscales*, *Lycopodales* and *Filicales*. The arrangement, it will be observed, is now an ascending one, whereas before it was descending.

ăc-rō-gna'-thŭs, s. [Gr. *akron* = a point, the tip; *gnathos* = the jaw.] A genus of fossil fishes established by Agassiz. The *A. boons*, an abdominal cycloid fish, was discovered by Dr. Mantell in a block of chalk from Southerham. (See his *Fossils of the British Museum*, p. 446.)

It contains a narrative of the achievements of the leading apostles, and especially of St. Paul, the greatest and most successful of them all. Its author was St. Luke (compare Luke i. 1–4 with Acts i. 1), who was Paul's companion from the time of his visit to Troas (Acts xvi. 8–11) to the advanced period of his life when he penned the 2d Epistle to Timothy (2 Tim. iv. 11). Internal evidence would seem to show that it was written in all probability about A. D. 61, though external testimony from the Fathers to its existence is not obtainable till a considerably later date. It consists of a thermometer with a large bulb filled with a dark-blue fluid, and enclosed in a box, the sides of which are blackened, and which is covered with glass. It is placed for a minute in the shade, then a minute in the sun, and then one more again in the shade. The mean of the two variations in the shade is then subtracted from that in the sun, and the result measures the influence due to the solar rays.

"By direct measurement with the actinometer . . . I find that out of 1,000 calorific solar rays, 816 penetrate a sheet of plate glass 0.12 inch thick; and that of 1,000 rays which have passed through one such plate, 859 are capable of passing through another."—*Note in Herschel's "Astronomy,"* 5th ed. ăc-tîn-ô-zô'-ă, s. pl. [Gr. *aktis*, genit. *aktinos*, and *zōon*=a living creature, an animal.] A class of animals which Cuvier would have placed under his Radiata, but which unite with Hydrozoa to constitute the Cœlenterata of Frey, Leuckart, and Huxley. It contains the sea-anemones and coral polypes. It is to animals of this class that the erection of the vast coral reefs is owing. Most Actinozoa have a central mouth with tentacles around it. Their alimentary canal freely passes, by means of a wide aperture, into the general cavity of the body. That cavity is then prolonged into

the stomach, which is internal, a character in which the Actinozoa differ from the Hydrozoa, to which they are closely allied.

ăc'-tion (Eng.), **ăc'-tioun** (O. Scotch), s. [In Ger. *aktion* (rhet.); Fr. *action*; Ital. *azione*; fr. Lat. *actio*=a doing, an action; fr. *ago* (*lit.*)=to set in motion, to drive, as cattle.]

1. The doing of a deed, the effecting of an operation.

(a) *Of persons or other living beings capable of carrying out a purpose:*

1. *Ord. Lang.*: The doing of a deed, as distinguished from thinking, feeling, speaking or even writing.

"The men seem formed for action, the women for love."—Gibbon: *Decl. and Fall*, ch. xlii.

"One wise in council, one in action brave."

Pope: *Homers's Iliad*, bk. xviii., 298.

2. *Spec.*: Fighting, which, demanding the utmost energy, is deemed in the last degree worthy of being called action.

"The King gave orders . . . that the Guards should be held ready for action."—Macaulay: *Hist. Eng.*, ch. viii.

3. *Manège*: The movement of parts of the body: as, A horse has a fine action.

4. *Technically*:

(a) *Mental Phil.*: A volition carried into effect.

"Now, what is an action? Not one, but a series of two things: the state of mind called a volition, followed by an effect. The volition or intention to produce the effect is one thing; the effect produced in consequence of the intention is another thing; the two together constitute the action."—J. S. Mill: *Logic*, vol. i., ch. iii., § 5, pp. 71, 72.

(b) *Ethics*: The doing of a deed viewed as an expression of the moral sentiments or state of a responsible being.

(c) *Oratory*: The accommodation of a speaker's voice, attitude, and especially his gesture, to the subject on which at the moment he is addressing his audience.

"For I have neither wit, nor words, nor worth,
Action, nor utterance, nor the power of speech,
To stir men's blood: I only speak right on."
Shakesp.: *Julius Caesar*, iii. 2.

"As 'twere encouraging the Greeks to fight;
Making such sober action with his hand,
That it beguiled attention, charm'd the sight;"
Shakesp.: *Tarquin and Lucrece*.

(b) *Of things*:

1. *Gen.*: The exertion of force or influence upon; operation, setting in motion, an acting upon.

"Some little effect may, perhaps, be attributed to the direct action of the external conditions of life."—Darwin: *Origin of Species*, ch. i.

(2) *Technically*:

(a) *Nat. Phil.*: The exertion of a force by one material body upon another. It may be by contact or by percussion. In either case it is met by resistance precisely equal to that produced by itself, or, in philosophical language, action and re-action are equal and contrary; that is, they are equal in force and contrary in direction. If an elastic ball be struck against the ground, action compresses it, and reaction brings it back again to its natural shape. When birds fly, the action produced by the strokes of their wings produces a contrary reaction on the part of the air, and it is this reaction which carries them forward.

" . . . the frost ruptures their cohesion, and hands them over to the action of gravity."—Tyndall: *Frag. of Science*, 3d ed., i. 24.

"Action and reaction being equal, and in contrary directions."—Herschel: *Astronomy*, 5th ed., § 723.

(b) *Chem.*: The production of a chemical reaction by the action of acid.

(c) *Geol. (spec. of volcanoes)*: In action=in eruption.

"I was surprised at hearing afterward that Aconcagua, in Chile, 480 miles northward, was in action on the same night."—Darwin: *Journal of Voyage round the World*, ch. xiv., p. 291.

(d) *Art (of machines), &c.*: Operation, movement, or anything similar produced by external agency of whatever kind (*lit. & fig.*).

"At length the new machinery was put in action, and soon from every corner of the realm arrived the news of complete and hopeless failure."—Macaulay: *Hist. Eng.*, ch. viii.

(e) *Law: In action.* [See No. II., 4, d.]

(f) *Mach., &c.*: The mechanism of a piano, organ, &c.; the movement or works of a watch or clock.

II. A deed done, an operation effected.

1. *Gen.*: A deed, something done.

¶ There is a shade of difference in meaning between an action in this sense and an act. Strictly speaking, action is the general word used of deeds, whether important or the reverse; while act is more appropriately applied to a deed of some im-

portance. The examples which follow illustrate the difference, which, however, is not universally observed.

"The Lord is a God of knowledge, and by him actions are weighed."—1 Sam. ii. 3.

"He made known His ways unto Moses, His acts unto the children of Israel."—Ps. ciii. 7.

"And she said to the king, It was a true report which I heard in mine own land of thine acts, and of thy wisdom."—2 Chron. ix. 5.

"Here perhaps
Some advantageous act may be achieved
By sudden onset." Milton: *P. L.*, ii. 363.

3. *Spec.*: A battle.

"All this William perfectly understood, and determined to avoid an action as long as possible."—Macaulay: *Hist. Eng.*, ch. ix.

3. *Old Scotch*: Affair, business, interest.

"Yit sa far as pertenis to our action, consider that our ennymes are to fecht aganis us, quhome we nevir offendin with inuris."—Bellend.: *Cron.*, bk. iv., ch. 17.

4. *Technically*:

(a) *Phys.*: The functions of the body, divided into vital actions, natural actions, and animal actions. [FUNCTIONS.]

(b) *Painting & Sculpture*: Passion or movement more or less correctly imitated. The more life-like and spirited the figures represented appear to be, the more action are they said to possess.

(c) *Epic Poetry, the Drama, or History*: The leading subject of an epic poem, drama, or history. In the former two it is divided into two portions—the principal fable treated in a lofty style, and the episodes which are introduced to give fullness of detail, the whole being carried on by a mixture of narrative, dialogue, and soliloquy. So also there are a leading theme and episodes in history.

"The voyage of Æneas from Troy to Italy, and his establishment in Latium (constituting, as they do, the main action of the Æneid)."—Lewis: *Credibility of Early Roman Hist.*, ch. ix.

"But these resting-places, as it were, must be rare, exceptional, brief, and altogether subordinate to what may be called the action, the unfolding the drama of events."—Milman: *Hist. of Jews*. (Pref.)

(d) *Law*:

The form prescribed by law for the recovery of one's due, or the lawful demand of one's right.

¶ In action. A plea in action is an answering the merits of a complaint; that is, by confirming, confessing and avoiding or denying it. Property in action is property which a man has not at present in his possession, but which another has covenanted to give him. He may sue for the performance of the contract, and the property thus recoverable is called, from the French word chose=a thing, a chose in action.

Chose in action is thus a thing of which a man has not the possession or actual enjoyment, but which he has a right to demand by action or other proceeding, as a debt, a bond, &c.

(e) *Comm. (in France and some other foreign countries)*: A certain share of a public company's capital stock. Persons may subscribe for actions in the latter as they do here for shares.

ăc'-tion-a-rŷ, **ăc'-tion-îst**, s. [Ital. *azionario*.] In France and other Continental countries: A proprietor of an action or share of a public company's stock.

***ăc'-tious**, a. [ACT.] Active.

¶ Used properly of the mind or spirit of a living being. "It is usual to speak of physical causes as *active*; but when any series of natural changes is scrutinized, it appears that what at first we called a cause, is itself the effect of some preceding event, which was, in its turn, an effect. . . . Strictly speaking, mind is the only active principle."—*Isaac Taylor: Elements of Thought*.

I. Ordinary Language:

(a) Of animated beings:

1. Acting, as opposed to being acted upon. [See example from Donne (B. 1).]

Wordsworth: Excursion, bk. i.

3. Continually employed, not idle or capable of idleness. Used of the body, the mind, or their operations. (*Opposed to idle or indolent*.)

Deserves to be beloved, but not adored.

No longer give an image all thine heart."

(b) *Active organs of locomotion*: The textures which form the skeleton, and by which its segments are united. They are contradistinguished from the *passive organs of locomotion*, which are the muscles to which the nerves convey the mandates of the will. (*Ibid., i. 67.*)

(c) Active disease: An acute disease.

"*Active congestion*," *active dropsies*, *'active hæmorrhage'*."—*Index to Tanner: Manual of Med.*

(b) Of things inanimate:

1. *Gram.*: Acting upon something else instead of itself being acted on.

An *active verb* or a *verb active*: One which expresses an action, and necessarily implies an agent and an object acted upon. In this classification there are two other descriptions of verbs—*passive* and *neuter* verbs, the former expressing passion, or suffering, or the receiving of an action; and the latter denoting neither action nor passion, but being, or a state of being. (*Lindley Murray: Grammar.*) A *verb active* is now generally called a *transitive verb*, in this Dictionary marked *v. t.*

A *compound active verb* (*Dr. Campbell*); an *active transitive verb* (*Crombie*): One which, when standing alone, is neuter and intransitive, but which, being followed by a preposition inseparably connected with it, forms with it a compound verb, which is active or transitive. Example: *To laugh at*. Omit *at*, and the verb is neuter, or intransitive, as "He laughed." Insert *at*, however, and a com-

pound *active verb* is formed, as "He laughed at them," "they were laughed at." (*Crombie: Etym. & Synt. Eng. Lang., 1802, p. 86.*)

2. Political Economy and Commerce:

Active capital: Wealth in the readily-available form of money, or which may without delay be converted into money, and used for any purpose requiring capital.

Active Commerce: The commerce of a nation which carries goods to and from its own and other lands in its own ships, and by means of its own sailors, in place of allowing the profit of these lucrative transactions to be reaped by foreigners. The commerce of the United States and of European countries is highly *active*, that of the Asiatic nations is mostly *passive*.

3. Law:

An *active debt*: A debt due to a person.

An *active trust*: A confidence connected with a duty.

Active use: A present legal estate.

His office was, indulgently to fit
Actives to passives: correspondence
Only his subject was."
Donne.

[ACTIVES.]

**active-valiant, a.* Possessed both of activity and valor.

2. *Figuratively (of things)*:

"Salt put to ice, as in the producing of the artificial ice, increaseth the *activity* of cold."—*Bacon.*

II. *Objective*: An occupation or sphere of action in which sustained and energetic action is required. ¶ In this sense it has a plural.

"A comparative survey of the history of nations, or what is called 'universal history,' will yield to us, as the first and most general result, evidence of a continually increasing variety of human *activities*, both in the life of individuals and in that of families and states."—*Haeckel: Hist. of Creation, i. 281.*

†*act-less, a.* [Eng. *act*; -less.] Without action.

In every act he our attention draws;
That at the last he may find just applause."
Denham.

3. *Among civilians*: An advocate or proctor in civil courts or causes.

"Virgil has indeed admitted Fame, as an *actress*, in the *Æneid*; but the part she acts is very short, and none of the most admired circumstances of that divine work."—*Addison.*

†*ac-tu-al (O. Scotch, *ac-tu-all), a.* [In Fr. *actuel*; Ital. *attuale*, fr. Lat. *actualis* = active, practical.]

A. Ordinary Language:

*I. Involving action as opposed to rest.

"Besides her walking and other *actual* performances."—*Shakesp.: Macbeth, v. 1.*

II. Real, in point of fact existing.

1. Existing in act or really, as opposed to existing no more than potentially; in action, in operation at the moment.

"Sin, there in pow'r, before
Once *actual*; now in body, and to dwell
Habitual habitant."
Milton: Par. Lost, bk. x.

¶ See also example under B. 1.

2. Existing in fact or in reality, instead of being simply imagined.

(a) Opposed to theoretical, speculative, imagined, or hypothetically assumed.

The mimic passion of his eye
Was turned to *actual* agony."
Scott: Rokeby, vi. 10.

" . . . viewed by the light of *actual* knowledge."—*Owen: Classif. of the Mammalia, p. 101.*

"*Actual* may be opposed to theoretical."—*Martineau: Comte's Positive Philosophy, ch. i., p. 3.*

To sight and feeling, or that in this sort
Have condescendingly been shadow'd forth
Communications spiritually maintain'd,
And intentions moral and divine."
Wordsworth: Excursion.

3. Existing as a case to be settled at present, in contradistinction to one disposed of at some bygone period.

" . . . it is necessary to understand the circumstances of the cases adduced as precedents, in order to be able to apply them with propriety to the *actual* case under discussion."—*Lewis: Credibility of Early Roman Hist., ch. iv., § 5, vol. i.*

B. Technically:

1. *Nat. Phil.* *Actual or dynamic energy*: Energy possessed by a body or bodies already in motion.

"Energy is possessed by bodies already in motion; it is then *actual*, and we agree to call it active or dynamic energy."—*Tyndall: Frag. of Science, i. 23.*

2. *Law*. *Actual* as opposed to *apparent* right of possession of property is one which will stand the test against all comers. The *actual* possession by a person of any property creates the presumption that he is its rightful owner. This presumption may be overthrown by proof adduced by a claimant that the property really is his; but unless he urge his suit, his right will ultimately lapse, and the wrongful possessor become the legal owner.

*3. *O. Scotch Law and Ch. Hist.* An *actual minister*: One ordained to the ministry, and not simply a probationer licensed to preach.

" . . . he always being an *actual* minister of the kirk, and shall elect none other than an *actual* minister to be so nominated and recommended be his majesty."—*Acts Ja. VI. (1617), p. 529.*

4. *Theol.* *Actual sins*: Those committed by the individual himself, as contradistinguished from *original sin*, that of Adam, the father of the race.

II. *In composition*, *ad*=to: as Lat. *adhæreo*, Eng. *adhere*=to stick to. In the Latin words into which it enters, the final letter *d* generally remains unchanged when it is followed by a vowel, or by some one of the consonants *b, d, h, m, and v*, as *adbello*, *addo*, *adhæreo*, *admiror*, and *adveho*; while, for euphony's sake, it is assimilated to the succeeding letter when that letter is one of the consonants *c, f, g, l, n, p, r, s, or t*, as *accelero*, *affero*, *aggredior*, *alligo*, *annuncio*, *appareo*, *arripio*, *assigno*, *attendo*. The Latin preposition *ad* enters directly or indirectly into the composition of many English words derived from the Latin; and the laws of assimilation are essentially the same in both tongues. adhere, *admire*, *advocate*; (2) assimilated: *accelerate*, *affluence*, *aggressive*, *allegiance*, *announce*, *apparent*, *assignation*, *attention*.

"This endless addition or *addibility* (if any one like the word better) of numbers, so apparent to the mind, is that which gives us the clearest and most distinct idea of infinity."—*Locke*.

ăd'-dī-ble, *ăd'-da-ble*, *a.* [Lat. *addo* = to put to, to add.] That may be added, capable of being added.

"The first number in every addition is called the *addable* number; the other the number or numbers added; and the numbers invented by the addition, the aggregate or sum."—*Cocker*.

**ăd'-dīce* (1), *s.* [ADZE.]

ad-dīct', *v. t.* [Lat. *addictus*, *pa. par.* of *addico* = to adjudge or assign, to devote to: *ad* = to; *dico*, *dicavi* = to dedicate, to consecrate.]

A. Ordinary Language:

1. Completely to give one's self over to a practice or pursuit. This may be good, indifferent, or bad.

(a) Good:

(c) Bad:

"A man gross indeed, sottish, and *addicted* to low company and low merriment."—*Macaulay: Hist. Eng.*, ch. iv.

¶ It is not creditable to human nature that the bad sense of the word now is the most common one, as if one more frequently gave himself over to an evil pursuit or practice than to a good one, and the devotion in the former case was, as a rule, greater than in the latter.

B. Technically. *Old Roman Law*: Various meanings, among others, to assign a debtor to the service of his creditor as a means of liquidating his debt. The principal of the debt, as contradistinguished from the interest accruing on it, was called *addictus*. With tacit reference to this Roman custom, Ben Jonson says, "I am neither author nor fauter of any sect, but if I have anything, defend it as truths."

"... the technical difference between the *nexus* and the *addictus*, or between the debt arising from the principal loan and that arising from unpaid interest."—*Lewis: Early Roman Hist.*, ch. xii.

"Those know how little I have remitted of my former *addictedness* to make chemical experiments."—*Boyle*.

ad-dīct'-īng, *pr. par.* [ADDICT.]

"But then it must be considered whether the charge of the *additament* will not destroy the profit."—*Bacon: Physiol. Rem.*

ad-dīt-a-mēn'-tūm, *s.* [Lat. = an addition, an increase.]

Old Anat.: That method of joining bone to bone which is called epiphysis. [EPIPHYSIS.]

Ch. Hist.: Pertaining to things indifferent, or looked upon as not worth disputing about. The term was introduced to designate an ecclesiastical controversy which broke out in the year 1548. The Emperor Charles V. having issued a paper, popularly called the *Interim*, in which he prescribed what faith and practice the Protestants were to adopt till the Council of Trent should dictate a permanent form of belief and worship, Maurice, Elector of Saxony, urged Melancthon and his friends to decide what portions of the document they would accept and follow. Melancthon, whose temperament was timid, and whose spirit was eminently conciliatory, proposed to go very far in the direction prescribed. Regarding many doctrines and practices in dispute between the antagonistic churches of Rome and Wittenberg as *adiaphoristic*—that is, as pertaining to matters indifferent—he considered that, for the sake of peace and harmony, the Emperor might be permitted to have his own way with regard to them, and that, to a very large extent, the *Interim* might be accepted and obeyed. Luther had died two years previously, but his followers, being specially irritated to find the doctrine of justification by faith figuring among the things *adiaphoristic*, refused to join in the great concessions proposed. A controversy in consequence arose between the followers of Luther and those of Melancthon. It was called the *adiaphoristic* controversy, and embraced two questions: (1) What things were indifferent; and (2) whether, with regard to things indifferent, the Emperor could or could not, in conscience, be obeyed. Geom. *Adjacent angle*: One contiguous to another, so that one side and the vertex are common to them both. The term is most frequently employed when the other sides enclosing the angles are in the same straight line.

In a triangle with one side produced, the angle contiguous to the exterior one is called the *interior adjacent*, whilst the others are denominated the *interior and opposite* angles.

2. *Eng. Hist. Plural*: The name or nickname of a political party which arose in 1866, and continued for a short time subsequently. In the year now mentioned, Earl Russell and Mr. Gladstone having introduced a Reform Bill embodying proposals for a considerable enlargement of the franchise, some of the more moderate Liberals declined to support it, and took counsel together how to prevent its passing into law. On this Mr. Bright, who was warmly in its favor, compared the new party to the discontented persons who repaired to King David when he was in the Cave of Adullam (1 Sam. xxii. 1, 2). The name took effect, and those to whom it was applied became, for the time, universally known as the Adullamites. A more sweeping Reform Bill than that proposed in 1866 having been carried under a Conservative Government a year later, the Adullamite party, which contained men widely differing on many points, ceased to act together, and gravitated some to the one and others to the other side of the House.

a-dũl-těr-ă-tion, s. [In Ital. *adulterazione*, fr. Lat. *adulteratio; adultero* = (1) to defile, (2) to falsify, to adulterate.]

I. The act of *adulterating*.

II. The state of being *adulterated*.

III. The thing which mixed with another debases its value.

Specially:

1. *Of different kinds of food, or any other articles possessed of marketable value*: "The act of debasing a pure or genuine article for pecuniary profit, by adding to it an inferior or spurious article, or taking one of its constituents away." Another definition which has been given is, "The act of adding intentionally to an article, for purposes of gain, any substance or substances the presence of which is not acknowledged in the name under which the article is sold."

The practice of adulteration must, more or less, have prevailed in every country, and in all but the most primitive ages. In England, as early as the thirteenth century, the legislature attempted, though with but partial success, to strike a blow against it, in the Act 51 Henry III., stat. 6, often quoted as the "Pillory and Tumbril Act." The methods of debasing salable articles which were adopted in those early times were few and simple; it was not till a comparatively recent period that the more ingenious forms of adulteration began to prevail. Once having taken root, however, they soon flourished greatly. Between 1851 and 1854, and even on to 1857, a sanitary commission on the adulteration of food, instituted in connection with the *Lancet* newspaper, and most ably conducted by Dr. Arthur Hill Hassall, made revelations of so startling a character that parliamentary action took place on the subject. The first legislative measure which followed—that of 1860—was a complete failure, the act being inefficient and useless. A stronger enactment was consequently passed in 1872. It was entitled "An Act to Amend the Law for the Adulteration of Food, Drink, and Drugs." Under this Act many prosecutions and convictions took place; but owing to the seller being entirely in the hands of the analyst,

bôil, bôy; pout, jôwl; cat, çell, chorus, çhin, bench; go, gem; thin, ðhis; sin, aş; expect, Xenophon, exist. ph = f. -cian, -tian = şan. -tion, -sion = şün; -tion, -şion = zhün. -tious, -cious, -sious = şüş. -ble, -dle, &c. = bel, del.

there being no appeal from his certificate, a feeling of dissatisfaction and distrust arose in the minds of manufacturers and traders, and another act was demanded. This, which came into force in 1875, gave the right of appeal to the Laboratory, Somerset House, in cases in which the correctness of the local analyst's certificate was disputed. In 1869 an Act had been passed to restrain the adulteration of seeds.

The various States of the Union have their own laws concerning adulteration. There is a national law regulating the sale of oleomargarine, an adulterated form of butter.

The most notable kinds of adulteration are the following: 1st. The addition of a substance of inferior value for the sake of adding to the bulk and weight of one more precious, as the mixing of water with milk, fat with butter, or of chicory with coffee. 2d. The addition of a substance with the view of heightening the color and improving the appearance of an article, as well as to conceal other forms of adulteration. Example: The coloring of pickles or preserves with salts of copper. 3d. The addition of a substance designed to aid or increase the flavor or pungency of another. Example: The addition to vinegar of sulphuric acid. 4th. The addition of a substance designed to insure that a larger quantity of another one shall be consumed. Example: Beer, one of the chief adulterants of which at present is salt, put into the liquor to insure that when one employs it to slake his thirst, the more he drinks the more thirsty will he become. Some of the substances used for adulterating articles of food—the salts of copper and sulphuric acid for instance—are poisonous. At present adulteration does not prevail as extensively as the public believe. The purchaser of a debased article is more likely to suffer in purse than in health.

2. Of anything else, material, mental, or moral, capable of being debased:

“... they manifest but little evidence of Egyptian, Asiatic, or Thracian adulterations.”—Grote: *Hist. of Greece*, vol. i., pt. i., ch. i.

3. One who gives the supreme place in his affections, not to God, but to idols, or to the world; idolatrous.

A. Of persons:

1. **Law & Ord. Lang.:** An unlawful commerce among two married persons not standing to each other in the relation of husband and wife, or between a married person and another unmarried. In the former case it has been called double, and in the latter single adultery. Varied punishments, mostly of a very severe character, have in nearly all countries and ages been inflicted on those who have committed this great offense. In some cases it has been deemed lawful for a husband or the woman's father to kill the guilty person if taken in the act. By the law of England, the slaughter of the offending parties in such cases is deemed manslaughter of a not very aggravated sort. The common law governs this matter generally in the United States with some variations in different states.

“So neither was anything but adultery esteemed a violation of the seventh [commandment].”—Jeremy Taylor: *The Decalogue*.

(*Will: Wharton's Law Lexicon*.)

2. *Now:* In English and American law, one who pleads a cause in any court, civil or criminal. It is not, properly speaking, a technical word, but is used only in a popular sense, as synonymous with barrister or counsel. [COUNSEL; ADVOCATE, A. 1.]

The *Queen's Advocate* was a member of the College of Advocates, whose office it was to advise and act as counsel for the Crown in questions of civil, canon, and international law. He ranked next to the Solicitor-General. (*Will: Wharton's Law Lexicon*.)

¶ At stations of the army the *judge-advocate* is the officer through whom prosecutions before courts-martial are conducted. There is also a *Judge-Advocate-General* for the army at large.

IV. In Scotland:

1. *Law:* A member of "the faculty of advocates," or Scottish bar. These have not derived their privileges from any Act of Parliament incorporating

them into a society, but have possessed them from a period of unascertained antiquity. The association is formed on the model of that of the French *avocats*, and, like it, is presided over by a dean, or doyen.

"The College of Justice, a great forensic society composed of judges, *advocates*, writers to the signet, and solicitors."—Macaulay: *Hist. Eng.*, ch. xiii.

2. A solicitor practicing in Aberdeen.

¶ The *Lord Advocate* is the principal Crown lawyer in Scotland. It is his duty to act as public prosecutor, which he does in great cases in which the Crown is interested, leaving the inferior ones to the procurators fiscal, who act under his instructions. He is virtually Secretary of State for Scotland, and, as a rule, it is through him that the Government proposes, explains, and defends the special legislation for that country.

ăd'-vō-câte, v. t. & i. [Lat. *advoco*=to call or summon to. In *Law*: To call an advocate to one's assistance: *ad*=to; *voco*=to call.] This is an old English word which fell into disuse and again revived. English Ecclesiastical Law: The right of presentation to a vacant benefice, what is called in Scotland *patronage*. [PATRONAGE.] This is of three kinds: (1) *Presentation*, when the patron has a right to present a clergyman to the bishop for institution; (2) *collation*, when the bishop is himself the patron of the living; and (3) *donation*, when the king or a subject, acting under the royal license, founds a church or chapel on the footing that it shall be subject to his visitation only, and not be placed under the bishop, and that he (the patron) shall have the power of putting a clergyman in it without presentation, institution, or induction. Hence advowsons are classified as *presentative*, *collative*, and *donative*. The reason why they were generally vested in lords of the several manors was that it was in most cases their ancestors, or at least predecessors more or less remote, who originally built the church, or were "advocates" of ecclesiastical privileges. [ADVOCATE.] An advowson still attached to a manor is called an *appendant*. If, however, it be once sold to a purchaser it ceases in all future time to be appendant, and is said to be in gross, or at large. Advowsons, originally trusts, are now considered heritable property.

"The *advowson* and right of next and perpetual presentation to the rectory of —, subject to the life of the present incumbent, now in his seventy-first year."—*Advertisement in Times*, 1875.

This law is not applicable in America from the fact that there is no established church.

1. An instrument consisting of an arched cutting blade of iron and a handle, the latter being placed transverse to the edge of the blade, whereas in the axe the two are parallel. It may be considered as a kind of crooked axe. It is used by shipwrights, carpenters, coopers, and other artisans, and is specially designed for chopping a horizontal surface of timber. (*Minshew*, &c.)

2. *Her.*: A common axe.

ādze, *v. t.* To shape by means of an adze.

ādzed, *pa. par.* [ADZE, *v.*]

ādz'-īng, *pr. par.* [ADZE, *v.*]

æ (pron. generally *ē*, and occasionally *ě*; when it has the latter sound, it is marked in this work *æ*).

I. *As an initial*: A Latin diphthong corresponding to the Greek *ai*, and used chiefly in words originally derived from the Greek language. When fully naturalized in English the Greek *ai* and Lat. *æ* become simply *e*. Thus the Gr. *aithēr* is in Lat. *æther*. In Eng. some writers, Tyndall for one, looking on the word as but partially naturalized, still write it with the diphthong *æther*; while the generality, regarding it as fully naturalized, make it *ether*. [ETHER.]

¶ Quite a multitude of Anglo-Saxon words commence with *æ*, but the *æ* becomes changed in various ways when these are naturalized in English. It is often transformed into *a* or *e*, less frequently into *ee*, or *ea*, or *o*, or *aw*, or *oi*, or *oa*; or it is wholly omitted.

Examples:

1. As *a*. A. S. *æcse*, *æx*=Eng. *axe*; *æcern*=*acorn*; *æfter*=*after*; *ænde*=*and*; *ængel*=*angel*; *æpl*, *æppel*, &c.=*apple*; *æt*=*at*.

2. As *e*. A. S. *æbung*=Eng. *ebbing*; *æfen*, *æfyn*, *æfenn*=*even*; *ælf*=*elf*; *æmetta*, *æmete*=*emmet*, *ant*; *Ænglisc*=*English*.

3. As *ee*. A. S. *æl*=Eng. *eel*.

4. As *ea*. A. S. *ættan*=to eat; *ærnian*=to earn.

5. As *o*. A. S. *æne*=Eng. *one*.

6. As *aw*. A. S. *æl*=Eng. *awl*.

7. As *oi*. A. S. *æl*=Eng. *oil*.

8. As *oa*. A. S. *æc*=Eng. *oak*.

9. With the *æ* wholly omitted. A. S. *æbare*=*bare*; *æend*=*and*.

II. *As a termination*. [Lat. genitive singular (usually) and nomn. pl. of the first declension, as *pennæ*, genitive singular and nomn. pl. of *penna*=a pen.]

Science (chiefly Biology): The termination of most orders of plants, and also of most families and sub-families of animals. Some of these terms are classical Latin, but the majority are only modern imitations of it. Examples: (a) Class. Lat.: *Algæ* (pl. of *alga*), Sea-weeds, the sea-weed order of plants; *Rosaceæ* (with *plantæ*=plants, understood), the Rosaceous order of plants, called by Lindley *Roseworts*. (b) Imitated from class. Lat.: *Psittacidæ*=the Parrot family of birds, &c.

æch-mō'-dūs, *s.* [Gr. *aichmē*=a point, and *odous*=a tooth.]

Palæont.: The name given by Sir Philip Egerton to a genus of fossil fishes formerly called *Tetragnolepis*.

æ-çid'-ī-ūm, *s.* [Dimin. fr. *aikion*=(1) an injury, a loss; (2) a wheal.] A little wheal. A genus of plants belonging to the alliance Fungales and the sub-order Cæomacei. The various species constitute what is called *rust*. The species are widespread and numerous. They are found on the dandelion, the violets, the pines, the epilobiums, and various other plants. On grain crops they may often be seen under the glumes of the calyx. When ripe they burst and discharge a powder of a bright orange color. One species is, in consequence, known to agriculturists as *red gum*. They do not appear to injure the crops. It is incorrect that the *Æcidium berberidis*, a parasite, as its name implies, upon the *Berberis*, or *Barberry*, tends to produce mildew on wheat growing in its vicinity.

æd, *in compos.* [A. S.] [EAD.]

æ-dēl-forș'-īte, *s.* [From *Ædelfors*, in Sweden.]

Min.: The name of two minerals.

Adze.

2. The name given by Retzius to a red zeolite from *Ædelfors*. It is considered by J. N. Berlin and by Dana to be an impure *Laumontite*. [LAUMONITE.]

æd'-ēl-īte, **ēd'-ēl-īte**, *s.* [*Ædel*, a shorter form of *Ædelfors*, in Sweden; *-ite*, Gr. suff.=belonging to, derived from.]

Min.: Prehnite from *Adelfors*. [PREHNITE.]

æ'-dile, *s.* [Lat. *œdilis*, originally from *œdes*=(1) a sanctuary, a temple, (2) a dwelling for men.]

1. (*Plural*.) In ancient Rome: Magistrates who had charge of public and private buildings, of aqueducts, roads, sewers, weights, measures, the national worship, and, specially when there were no censors, public morality. There were two leading divisions of *œdiles*—*plebeian* and *curule*. Two of the former class were created A. U. 260, to assist the tribunes in their judicial functions. The same number of *curule* *œdiles* were elected from the patricians A. U. 387, to perform certain public games. For a time these officers were chosen alternately from the patricians and the plebeians, then they were taken indiscriminately from either of these castes. Their insignia of office were like those of the old kings—the *toga prætexta* (a purple robe) and the *sella curulis*, or *curule chair*, ornamented with ivory. To the ordinary two plebeian *œdiles* Julius Cæsar added another pair, called *cereali* *œdiles*, to look after the corn supplies and the food of the capital generally.

æ'-dile-ship, *s.* [Eng. *œdile*; *-ship*.] The office of an *œdile*.

It appears to be the stock whence all the varieties of the domestic goat sprung. The male has large horns, whilst those of the female are short or wanting. It inhabits the Caucasus and the mountains of Persia, and is still more abundant in Asia Minor. It may possibly be wild even in the Alps and the Pyrenees, though the identity of species from these various localities has been doubted. It is gregarious. Its name in the Persian mountains is *Paseng*.

æ-gā-grōp'-ī-lā, *s.* [Lat. *ægagrus* (q. v.); *pilus*=hair.] A ball composed of hair, found in the stomach of the chamois.

æ-gēr'-ī-ā, *s.* [*Ægeria*, or *Egeria*, a nymph or goddess from whom Numa Pompilius pretended that he received his laws.] A genus of *Sphinxes* (Hawk-moths), the typical one of the family *Egeridæ*. Example, the Currant Clear-wing, *Æ. tipuliformis*, so called from its resemblance to the two-winged tipula, while the English appellation points to the fact that the larva feeds on currant bushes.

æ-gēr'-īd-æ, *s. pl.* [ÆGERIA.] A family of *Sphinxes* (Hawk-moths). The wings are so transparently clear that the insects are popularly called *Clear-wings*. This character, however, obtains also in the neighboring family of *Sesiadæ*.

æ-gī'-ās, *s.* [Gr. *aigias*=a white spot in the eye (*Hippocrates*).] (For signification see etym.)

æ-gīl'-ōps, *s.* [In Fr., Sp., & Ital. *egilope*; Port. *egilope*, *egilops*; Gr. *aigilōps*=(1) a wild oat, (2) a kind of oak, (3) an ulcer in the eye. From (1) *aigilos*, an herb of which goats are fond; *aix*, genit. *aigos*=a goat; and (2) *ōps*=the eye, the face.]

2. The specific name of a gall-bearing oak, *Quercus ægilops*.

II. *Med.*: A tumor in the corner of the eye adjacent to the nose. It is so called because goats are supposed to be specially liable to it.

"*Ægilops* is a tubercle in the inner canthus of the eye."—*Wiseman: Surgery*.

***ægir-in-ôn**, s. [Deriv. uncertain. Possibly it is Gr. *aix*, genit. *aigos* = a goat; *rhinon* = shield; or *rhinos* = skin, hide. Why so called is not obvious.] "A sort of ointment made of the berries of the black poplar-tree." (Kersey.)

ægir-ite, **æg-yr-ite**, **æg-ir-ine**, s. [In Ger., Sw., &c., *ægirin*, fr. *Ægir*, the Scandinavian god of the sea.]

1. The shield of Jupiter.

"The dreadful *Ægis*, Jove's immortal shield,
Blaz'd on her arm, and lighten'd all the field.

Form'd the bright fringe, and seem'd to burn in gold."

Pope: *Iliad*, ii., 526-29.

His blazing *ægis* thrice Apollo shook."

Ibid., xvi., 859-60.

"Gone were the terrors of her awful brow,
Her idle *ægis* bore no Gorgon now."

Byron: *Curse of Minerva*.

The *Ægle Marmelos*, the Bhel, Bale, Bilwa, or Bengal Quince, a thorny tree with ternate leaves and a delicious pulpy fruit, with a smooth, yellow, very hard rind, grows wild in India. Dr. Royle says that the astringent rind is used in dyeing yellow. In Ceylon a perfume is prepared from it, and the seed is employed as a cement. In India the legumes are used in asthma, the fruit, a little unripe, in diarrhoea and dysentery, and a decoction of the root and bark in hypochondriacal complaints and palpitation of the heart.

4. *Astron.*: An asteroid, the ninety-sixth found. It was discovered by Coggia, on February 17, 1868.

***æg-lōgue**, s. [ECLOGUE.] An eclogue (q. v.). "A pastoral song." (Kersey.) A word introduced by Petrarch, who derived it from Gr. *aix*, genit. *aigos* = a goat, and *logos* = speech, and attributed to it the meaning "the talk of goatherds," in place of the "talk of goats." Spenser and some other writers adopt it. It is simply *eclogue* spelled in a different way, owing to the fact that its proper etymology has been misunderstood. [ECLOGUE.]

"Which mov'd him rather in *æglogues* otherwise to write."—Spenser: *Pastorals*.

æg-gō-brōn-chōph-ōn-ŷ, s. [Gr. *aix*, genit. *aigos* = a goat; *bronchos* = the windpipe; *phōnē* = a sound.] A mixture of two sounds called respectively *ægophony* and *bronchophony*, heard in cases of pleuro-pneumonia, when part of the lungs having undergone hepatization with bronchophony, we hear the sound modified by the effusion of matter. Laennec compared it to the squeaking voice of Punchinello, but superadded to this there is a tremulous or vibratory character in the sound, which, moreover, seems alternately to approach to and recede from the ear in sudden jerks. (Dr. Williams: *Cyclop. Pract. Med.*, "Pneumonia.")

æg-gō-phōn-ic, a. [ÆGOPHONY.]

Med.: Pertaining to ægophony.

"... through the whole of the ægophonic region."

ælf, in *compos*. [A. S.] An elf, a genius (*Bosworth*), as *Ælfwin* [ELFWIN] = victorious elf, or genius. Camden, Todd, and others consider *ælf*, *ulf*, *welf*, *hulph*, *hilp*, *helfe*, and *helpe* in proper names all to mean *help*, and make *Ælfwin* = victorious help; *Ælfric* = an auxiliary governor; *Ælfric* = a lender of assistance. (Gibson, Camden, Todd's Johnson.)

ā-ēl-lō, s. [Lat. *aello*; Gr. *aellō* = a storm-swift, the name of a harpy, also one of Actæon's dogs; fr. *aella* = a stormy wind, specially a whirlwind.] A genus of bats founded by Leach on a single species of unknown habitat, the *A. Cuvieri*.

Æ-nē-īd, s. [Lat. *Æneis*, fr. *Æneas*.] One of the great epic poems of the world. It was written in Latin by Virgil, and published after his death, which took place about 16 B. C. Its hero is *Æneas*, one of the Trojan chiefs, whose adventures during and after the siege of Troy it recounts, till the time when he succeeded in fully establishing himself in Italy. The poet, like the majority of his countrymen, believed that the imperial family of the Cæsars had *Æneas* for their remote ancestor, and that many other illustrious Romans were descended from his companions in arms.

Æ-ō-lī-an (1), **æ-ō-lī-an** (2), a. [From *Æolus*, the god of the winds and king of the volcanic islands off the coast of Italy, now called the "Lipari" Islands, in the caverns of which the winds were supposed to be confined. This is probably an old way of attempting to explain the occurrence of noises as of struggling air in the caverns, the result, perhaps, of volcanic commotion.]

1. Pertaining to *Æolus*, or the cavern in which he was fabled to keep the winds confined.

"Less loud the winds that from th' *Æolian* hall
Roar through the woods, and make whole forests fall."

Pope: *Homer's Iliad*, xiv., 459, 460.

2. Pertaining to the wind.

"A wind that through the corridor
Just stirs the curtain, and no more,
And, touching the *æolian* strings,
Faints with the burden that it brings!"

Longfellow: *Golden Legend*.

Æolian harp, s. A harp played by *Æolus*—in other words, by the wind. It is made by stretching strings of catgut over a wooden sound-box. If exposed to the action of the wind, a succession of pleasing sounds proceed from it, plaintive when the breeze is slight, but bolder as it increases in force.

"As an *Æolian harp* through gusty doors
Of some old ruin its wild music pours."

Longfellow: *The Student's Tale*.

"Like an *Æolian harp* that wakes
No certain air, but overtakes
Far thought with music that it makes."

Tennyson: *Two Voices*.

Æ-ō-lī-an (2), **Æ-ōl-ic**, a. [Lat. *Æolius*, *Æolicus*; Gr. *Aiolios*, *Aiolikos* = pertaining to *Æolia*, or *Æolis*.]

Æolic dialect: One of the three great dialects of the Greek language, the others being the Doric and the Ionic. The expression *Attic dialect* often occurs, but this should be regarded as the normal type of Greek rather than as a divergent dialect of that tongue.

Æolic digamma: A letter similar in character and sound to the letter F. It is so called because the *Æolians* used to prefix it to certain words beginning with a vowel, and insert it between vowels in the middle of words. It does not appear as a letter of the ordinary classical Greek alphabet.

Æolic rocks (*Geol.*): Rocks formed by the action of the wind. Example, sand dunes. They are sometimes called also *aërial rocks*.

Æolic verse, called also *Eulogic*, *Archilochian* and *Pindaric verse*: A verse consisting of one iambus or spondee, then of two anapests separated by a long syllable, and then another syllable concluding all.

Æ-ō-lī-an, s. [The adjective used substantively.] A native of *Æolia*.

æ-ōl-i-dæ, s. pl. [ÆOLIS.]

æ-ōl-ist, s. [From Lat. *Æolus*.] [ÆOLIAN.] A pretender to inspiration. [INSPIRATION.] (Swift.)

æ-ōl-ō-phōn, s. [EOLOPHON.]

æ-ōn, s. [Lat. *æon* = eternity, fr. Gr. *aiōn* = (1) a period of time, (*spec.*) a lifetime, a generation; (2) a long space of time, eternity; (3) a space of time clearly marked out, a period, an age, a dispensation. (Liddell & Scott.)] The Lat. *æon*, given above, which is simply the Gr. *aiōn*, with the substitution of the Lat. diphthong *æ* for the Gr. one, *ai*, is rare. The common Lat. word is *ævum*, which is used in poetry in most of the senses of *aiōn*, and is simply that Gr. term Latinized, the inserted *v* being the remains of the *Æolic digamma* (q. v.). Cognate words are Goth. *aws*, crude form *awa*. Bopp, Graff and Kuhn derive all these terms from Sansc. *i* = to go.]

æ-py-or'-nīs, s. [Gr. *aipeus*=high and steep; *ornis*=bird.]

Palæont.: A genus of gigantic birds founded by Isidore Geoffroy Saint-Hilaire on some fossil bones and eggs brought from Madagascar. It belongs to the order Cursores, and has a certain affinity to the ostrich, but it is believed to have been twice as high as that tall bird. The eggs were 12½ inches in length, and had a capacity equal to six ostrich eggs, or to 148 of the domestic fowl. The remains were found in alluvial soil, and were, geologically viewed, so recent that it is open to question whether living specimens may not yet be found in the unexplored parts of Madagascar.

ā-ēr-ōl-īte, **ā-ēr-ōl-īth**, *s.* [In Ger. *aerolit*; Fr. *aérolithe*; Port. *aerolithe*, *aerolito*, fr. Gr. *aēr*=the air; *lithos*=a stone.] A stone which falls from the air or sky. The name is somewhat inappropriate, now that it is known that the connection of these stones with the air is but slight, they simply traversing it as, under the operation of gravity, they fall from the regions beyond to the earth. They have also received the name of *meteorites*, from the fact that the fall of one or more aerolites is generally preceded by the appearance of a meteoric fire-ball, which, after gleaming forth for a brief period, then explodes, irresistibly suggesting the inference that the aerolites which fall constitute its fragments. Hence aerolites and large meteorites are classed under one category. Sometimes *aerolite* and *meteorite* are made quite synonymous terms; but it is better to draw a distinction between the two, making *meteorite* the general word and limiting *aerolite* to the stony varieties of the genus.

Aerolite.

The aerolites in this limited sense, as a rule, fall to the ground in an incandescent state. They are generally sub-angular, but with the angular points rounded off, and are coated, to the depth of about a quarter of an inch, with a black crust like varnish. When fractured they commonly display a series of small gray spherical bodies in a gritty substance, occasionally with yellow spots interspersed. When thus consisting of stony spherules they are sometimes termed *chondritic aerolites*, from Gr. *chondritēs*=of the shape or size of groats; *chondros*=a corn, grain, groat. Iron is found in large quantity in nearly every aerolite, sometimes malleable, and sometimes in a state of oxide. It is always in connection with nickel. Other substances found in more limited quantity in aerolites are silica, magnesia, sulphur, alumina, lime, manganese, chrome, cobalt, carbon, soda, and water. No new element has been found, but the combination of the old ones is different from any occurring in this planet.

Though the fact that stones could fall from the sky to the earth was doubted by the scientific almost till the close of the eighteenth century, the occurrence of such a phenomenon had been again and again popularly reported in various countries, and from a high period of antiquity. There is reason to believe that the object of worship in many a pagan shrine in ancient times was an aerolite; that this was the case with the idol worshiped in the great temple of Diana at Ephesus is all but implied in the town-clerk's words, "The image which fell down from Jupiter" (Acts xix. 35). [AEROSIDERITE, METEORITE, SIDERITE.]

ā-ēr-ōl-ī-ic, *a.* [AEROLITE.] Pertaining to an aerolite; of the character of an aerolite.

ā-ēr-ōl-ō-gy, *s.* [In Fr. *aérologie*, fr. Gr. *aēr*=the air; *logos*=a discourse.] The science which treats of the air. When little could be done in this department of knowledge except to record facts, *aérography* (a writing about or a description of the air) was an appropriate enough name; but now that the causes of many aerial phenomena are becoming known, *aerology* (a discourse or reasoning about the air) is the more suitable term.

ā-ēr-ō-mān-cy, ***ā-ēr-ō-mān-tie**, or ***ā-ēr-ē-mān-cē**, *s.* [In Fr. *aéromancie*; Ital. *aerimanzia*; Lat. *aeromantia*, from Gr. *aeromanteia*: *aēr*=air, and *manteia*=divination.] Divination by means of the air and its movements.

ā-ēr-ōn-āu'-tīc, *a.* [(1) Lat. *aēr*=the air, or Gr. *aēr*=the air; (2) Lat. *nauticus*, Gr. *nautikos*=nautical, pertaining to ships.] Pertaining to the navigation of the air by means of balloons, or in some similar way.

ā-ēr-ōn-āu'-tīcs, *s.* [In Fr. *aéronautique*.] The science or art which treats of aerial navigation. With the example before him of birds created anatomically on a type in some essential particulars similar to his own, man was certain to covet and seek to attain the art of flying. Two fatal difficulties, however, appear forever to forbid his success in this endeavor unless he be assisted by machinery to supplement his physical defects. Compared with a bird he is proportionately heavier, and that to no slight extent; whilst, in addition to this, the conformation of his breast does not afford a proper point of attachment for the powerful muscles required to use his arms after the manner of wings. Any one carving the breast of a fowl can at once perceive the superiority in this respect, even of that type of bird, to the strongest man.

The term was first used in its present sense by Wolf about the middle of the last century. According to Herbert Spencer, one characteristic of æsthetic feelings is that they are separated from the functions requisite to sustain life, and it is not till the latter have had proper scope accorded them that the former gain power enough to act. The delight in painting, music, sculpture, poetry, and the drama, nay, even in fine mathematical demonstrations, is æsthetic; and the science investigates the origin of such sensations, the laws which characterize them, and the excellent effects which, when they are not abused, result from their operation to humanity. (*Herbert Spencer: Principles of Physiology*, 2d ed., vol. ii., §§ 533-40.)

æstho-physiology, s. [Gr. (1) *aisthēsis*=perception by the senses, especially by feeling, from *aisthanomai*=to perceive; and (2) *physiology* (q. v.). 3. **Bot.**: A term used of the manner in which the parts of a blossom are arranged within a flower-bud before the opening of the latter. It is more rarely called *prefloration*. The word *æstivation* is separately applied to the calyx, the corolla, the stamens, and the pistil, but not to the flower in general. There are many kinds of æstivation. It may be imbricated, or valvate, or convolute, or circinate, or twisted, or of various other types.

The lower bulb was protected by a metallic envelope, and gave the temperature of the air, whilst the upper one was blackened, and was surrounded by a metallic cap, designed to protect the bulb from terrestrial radiation. "The sensibility of the instrument," says its inventor, "is very striking, for the liquor incessantly falls and rises in the stem with every passing cloud."

æ-thū'-sā, s. [In Fr. *æthuse*; Gr. *aithō*=to light up, to kindle, to burn. The name is given from its acridness.] Lesser Hemlock, or Fool's Parsley. A genus of plants belonging to the order Apiacæ, or Umbellifers. The *Æ. cynapium*, or Fool's Parsley, occurs in Europe, and is very common in North America, taking the form of an evergreen shrub. In aspect it partly resembles garden parsley, but is darker in color, and is not curled. Its odor is unpleasant. It is so acrid as to be poisonous. As an antidote, Dr. Christison recommends that milk be swallowed, that mustard-poultices be applied to the legs, and that the body be sponged with vinegar.

ā-ē-tī'-tēs, s. [Lat. *aëtites*; Gr. *aetitēs*: from *aetos*=an eagle.] The eagle-stone: a nodule or pebble which received its name from the belief that the eagle transported it to its nest, knowing that it would not be possible without it to hatch its eggs. Nor were these its only reputed virtues. Thieves could be discovered by its aid; and, according to Lupton, it was a charm to be used by women in childbirth, and produced love between man and wife. Kersey's definition of it is, "The eagle-stone, a certain stone which, when shaken, rattles as if there were another within it." Any pebble or nodule answering to this description would have been called *aëtites*, or eagle-stone; but, apparently, the term was most frequently used of these nodules found abundantly in the carboniferous strata,

af-fīn'-i-tý, s. [In Ger. *affinität*; Fr. *affinité*; Ital. *affinità*, fr. Lat. *affinitas*=(1) neighborhood, (2) relationship by marriage, (3) union, connection.]

I. Ordinary Language & Law:

1. *Lit.*: The relationship contracted by marriage between a husband and his wife's kindred, or between a wife and her husband's kindred. It is opposed to consanguinity, or natural relationship

by blood. It is of three kinds: (1) *direct*, viz., that subsisting between a husband and his wife's blood relations, and *vice versa*; (2) *secondary*, or that which subsists between a husband and his wife's relations by marriage; and (3) *collateral*, or that which subsists between a husband and the relations of his wife's relations.

¶ The word *affinity* in this, as other meanings, may be followed by *with*, *to*, or *between*.

"And Solomon made *affinity* with Pharaoh, king of Egypt, and took Pharaoh's daughter, and brought her into the city of David."—1 *Kings* iii. 1.

"... The Moor replies,
That he you hurt is of great fame in Cyprus,
And great *affinity*."—*Shakesp.: Othello*, iii. 1.

"He would doubtless gladly have avoided the scandal which must be the effect of a mortal quarrel between persons bound together by the closest ties of consanguinity and *affinity*."—*Macaulay: Hist. Eng.*, ch. vii.

2. Connections (not necessarily by 1.) ; associates.

3. *Fig.*: The resemblance produced, more or less remotely, by a common origin between languages now in many respects distinct. Or generally, the similarity between things which essentially resemble each other.

"There is a close *affinity* between imposture and credulity."—*Lewis: Influence of Authority*, ch. iii.

II. *Biol. Sing. & plur.*: A resemblance, or resemblances, on essential points of structure between species, genera, orders, classes, &c., really akin to each other, and which should be placed side by side in any natural system of classification. *Affinity* differs from *analogy*, the latter term being applied to resemblances between animals or plants not really akin, but which ought to be more or less widely separated in classifications. Thus the falcons, the hawks, the eagles, &c., are related to each other by genuine affinity; but the similarity on certain points, such as the possession of retractile claws, between the raptorial birds and the feline race of mammals, is one only of analogy.

"We can understand, on these views, the very important distinction between real *affinities* and analogical or adaptive resemblances."—*Darwin: Origin of Species*, ch. xiii.

"... the nature of the *affinities* which connect together whole groups of organisms."—*Ibid.*, pt. i., ch. i.

III. Chemistry:

1. Chemical affinity, or chemical attraction, is the force by which union takes place between two or more elements to form a chemical compound. According to another definition, it is a force exerted between two or more bodies at an infinitely minute distance apart, by which they give rise to a new substance having different properties to those of its component parts. Elements have the greatest affinity for other elements which differ most in their chemical properties. Thus H has great affinity for Cl and O, but the affinity between O and Cl is much weaker. Acids unite readily with alkalies; most metals with sulphur. When two salts are mixed together they are decomposed if an insoluble substance can be formed: thus $\text{AgNO}_3 + \text{NaCl}$ yields NaNO_3 and insoluble AgCl , and $\text{BaCl}_2 + \text{MgSO}_4$ yields MgCl_2 and insoluble BaSO_4 . A strong acid generally expels a weaker one, as H_2SO_4 expels HCl or CO_2 , and CO_2 precipitates SiO_2 ; but when two salts are fused, if a more volatile compound is formed, it is driven off, as when NH_4Cl is heated with dry CaCO_3 then $(\text{NH}_4)_2\text{CO}_3$ volatilizes. SiO_2 fused with salts expels the strongest acids and forms silicates. Iron filings heated to redness in a tube decomposes the vapor of water, but H_2 passed over red-hot oxide of iron reduces it to a metallic state. These reactions are due to the diffusion of gases, the resulting gas being diffused through the mass of vapor passing through the tube. The relative affinities between different substances varies with their temperature, insolubility, and power of vaporization. The nascent state is favorable to chemical combination: thus H and N unite readily when organic matter containing N is decomposed by heat or putrefaction, also H with S. This is due to the bonds of the atoms being liberated at the moment of decomposition. *Disposing affinity* is the action of a third body, which brings about the union of two other bodies, as $\text{Ag} + \text{SiO}_2$ and alkali form a silicate of silver; Pt is attacked by fused KHO. Organic decompositions in the presence of caustic alkali or lime are also examples. Catalysis is the action of a body to bring about a chemical reaction whilst the body itself undergoes no perceptible change, as MnO_2 in the preparation of O from KClO_3 . Certain chemical compounds at high temperatures are dissociated from each other, as NH_4Cl at high temperatures forms $\text{NH}_3 + \text{HCl}$. Chemical union is promoted by finely dividing the substances; thus finely-divided metals, as iron or lead, take fire in the air, uniting with O. Alternation of temperature alters the affinity; thus mercury heated to its boiling-point absorbs oxygen, which it liberates at a higher temperature; also BaO absorbs O at a low heat, forming BaO_2 , and gives it off at higher temperatures.

Strong bases generally replace weaker bases; thus alkalies precipitate oxides of iron, &c. (See *Watts' Dict. of Chemistry*.)

"The *affinity* which held together the elements of the organic substances is destroyed by the cause which occasioned their death, and they are set free to obey new *affinities* and form new compounds."—*Todd & Bowman: Physiol. Anat.*, i. 12.

2. *Affinity of solution* is such an affinity as exists between a soluble salt and the fluid in which it is dissolved. Till the liquid is saturated with the salt the two can combine in an indefinite ratio, instead of being limited to the fixed proportions in which alone chemical affinity operates.

IV. *Nat. Phil. Current affinity*: The force of voltaic electricity.

"The comparison may be best instituted between nervous power and the force of voltaic electricity, or *current affinity*, as it has lately been called, which is developed in the galvanic battery."—*Todd & Bowman: Physiol. Anat.*, i. 237.

A. Transitive:

Essential meaning: To meet face to face, to confront.

¶ Trench considers *affront* to have originally meant to strike on the face. Wedgwood and many others think it was to meet face to face.

1. To do so without its being implied that such an encounter is a hostile one.

That he, as 'twere by accident, may here
Affront Ophelia."—Shakespeare: *Hamlet*, iii. 1.

And rushing forth into the empty field,
Against Cambello fiercely him address,
Who him *affronting* soone to fight was ready prest."
Spenser: *F. Q.*, IV., iii. 22.

B. Intransitive: To offer an insult to.

¶ In the example there is probably an ellipsis to be supplied, in which case the verb would become transitive.

"Your preparation can *affront* no less
Than what you hear of; come more, for more you're ready,"—Shakespeare: *Cymbeline*, iv. 3.

¶ In this sense the word may be used of God or His worship.

(For an excellent account of the distinction between *agapāō*=to love, and *phileō*, which more generally implies sexual affec-

tion, or affection at least instinctive rather than founded on reason, see *Trench's Synonymes of the New Testament*, pp. 43-49.)]

Church History: "A love-feast 'a kind of feast held by the primitive Christians in connection with the administration of the sacred communion. Either before or after the Lord's Supper—it is not completely decided which—the Christians sat down to a feast provided by the richer members, but to which all, however poor, who belonged to the Church, were invited. As piety declined, the *Agapæ* began to cause scandal, and finally they were condemned by the Council of Laodicea and the 3d of Carthage, in the fourth century, and by that of Orleans in A. D. 541. It was, however, found hard to eradicate them, and finally the Council in Trullo, A. D. 692, launched the penalty of excommunication against those who, in defiance of previous prohibitions, persisted in carrying them on.

I. *Botany*:

*1. *Gen.*: The English name of the fungi belonging to the genus *Agaricus* (q. v.).

"She thereat, as one

That smells a foul-flesh'd *agaric* in the holt,

And deems it carrion of some woodland thing."

(b) An Assyrian herb.

II. *Pharmacy*. What was called the *Surgeon's Agaric*, or *Agaricus chirurgorum*, was the *Boletus ignarius*. The *Agaric of the oak*, or *Agaricus quercus*, was also the *Boletus ignarius*.

"There are two excrescences which grow upon trees, both of them in the nature of mushrooms: the one the Romans call *boletus*, which groweth upon the roots of oaks, and was one of the dainties of their table; the other is medicinal, and is called *agaric*, which groweth upon the tops of oaks, though it be affirmed by some that it groweth also at the roots."—*Bacon*.

III. *Min. Agaric mineral*: So called from its resemblance in color and texture to the *Agaricus* genus of Fungi. A sub-variety of calcite, an extensive mineral species, or rather genus, of which the 23d variety of series of sub-varieties described by Dana includes those "deposited from calcareous springs, streams, or in caverns." Under this heading five sub-varieties are enumerated, of which the *Agaric Mineral*, called also *Rock-milk*, is the fourth, the others being *Stalactites*, *Stalagmites*, *Calcsinter*, and *Rock-meal*. *Agaric mineral* is either yellowish or greyish-white. It is soft in texture, dull in lustre, and so light that it floats for a short time on water. It is almost entirely composed of carbonate of lime. In Switzerland it is used to whiten houses.

a-gär-i-cä'-cē-æ, *s. pl.* [AGARICUS.] An order of plants belonging to the Alliance Fungales. It contains the most highly organized species belonging to the Alliance. It is called also HYMENOMYCETES (q. v.).

Zool.: The name given by Lamouroux to a genus of Zoöphytes containing what are called the *Mushroom Madrepores*. Lamarck enumerates five species, and Parkinson seven.

ag-är-ic-ūs, *s.*; *pl.* **ag-är-ī-çī**. [Gr. *agarikon*.] [AGARIC.] A genus of plants, the typical one of the Fungus or Mushroom family, consisting of the spe-

cies which possess a fleshy *pileus* or cap, with a number of nearly parallel or radiating plates or gills on its lower side, bearing spores, the whole be-

ing supported upon a more or less lengthened stalk. More than one thousand species are known. They may be separated into five natural divisions, according as the color of the spores is white, pink, ferruginous, purple-brown, or black. There are many sub-genera. Some species are poisonous. It is difficult to identify these with the accuracy which the importance of the subject demands; but the following marks have been given: An agaric is poisonous, or at least suspicious, if it has a very thin cap compared with the thickness of the gills, if the stalk grows from one side of the cap, if the gills are of equal length, if the juice is milky, if it speedily decays into a dark watery fluid, if the collar round it is like a spider's web. All these characteristics do not meet in the same individual, but the presence of one or more of them is enough to inspire caution. The eatable agarics are the *A. campestris*, or Common Mushroom—that often cultivated in gardens; the *A. Georgii*; the *A. pratensis* or Fairy-ring Mushroom; the *A. personatus*, &c. The *A. cantharellus*, *piperatus*, &c., contain sugary matter, considered by Liebig to be mannite. The agaric of the olive is poisonous, but pickling and subsequent washing render it harmless, as has been ascertained by experience in the Cévennes. Similarly, the application of vinegar and salt deprives the poisonous *A. bulbosus* of its noxious qualities; but too much caution cannot be used in experimenting upon such dangerous articles of food. A curious circumstance about some agarics, such as the *A. Gardneri* of Brazil and the *A. olearius* of the south of Europe, is that they are luminous.

Mushrooms (*Agarici*).

äg'-ate, ***äg'-ath**, *s.* [In Ger. *achat*, *agat*; Fr. *agate*; Ital. *agata*; Lat. *achates*; Gr. *achates*.]

1. *Min.*: A mineral classed by Dana as one of the cryptocrystalline varieties of quartz, some of the other minerals falling under the same category being chalcedony, carnelian, onyx, hornstone, and jasper. Phillips, and the earlier school of mineralogists, had made quartz and chalcedony different minerals, and placed agate under the latter species. The classifications differ but little; for Dana defines agate as a variegated chalcedony. He subdivides agates by their colors into those which are banded, those in clouds, and those whose hues are due to visible impurities. Under the first category is reckoned the eye-agate, and under the third the moss-agate, or mocha-stone, and the dendritic agate. Other terms sometimes used are ribbon-agate, brecciated agate, fortification agate, &c. Of these the most familiar is the fortification agate, or Scotch pebble, found in amygdaloid, and with layers and markings not unlike a fortification. Moss-agate does not, as the name would lead one to infer, contain moss, the appearance of that form of vegetation being produced, in most cases at least, by an infiltration of mineral matter.

"The *agate* (or *agath*) was in old time of great estimation, but now it is in more request. Found it was first in Sicilie, neare unto a river called also *Achates*, but afterward in many other places."—*Holland: Plinie*, bk. xxxvii, o. 10.

II. Bot. [In Fr. *agave*; Sp. & Port. *agave*.] A genus of plants belonging to the order Amaryllidaceæ, or Amaryllids. The species have large fleshy leaves, with teeth ending in spinous points. From the center of a circle of these leaves there rises, as the plant approaches maturity, a tall scape of flowers. The idea that the agave flowers but once in a hundred years is a gardener's fable; what really happens is, that the plant taking many years (ten to seventy it is thought) to come to maturity, flowers but once, and then dies. The best known species is the *Agave Americana*, or American Aloe. The hard and spiny leaves of this fine endogenous form impenetrable hedges. The fiber is tough enough to make excellent cordage. The expressed juice may be employed as a substitute for soap. It may also be manufactured into a liquor like cider. The root is diuretic and antisyphilitic. The plant is now cultivated in the south of Europe. The *A. Mexicana* has similar properties to those of the *A. Americana*. The *A. saponaria* is a powerful detergent, and its roots are used as a substitute for soap.

(See *Wedgwood*, &c.) A. Ordinary Language:

I. Of organized beings, taken singly:

1. The whole duration of an organized being who or which has a term of existence and then passes away.

"... so the whole *age* of Jacob was an hundred forty and seven years."—Gen. xlvii. 28.

2. That portion of the existence of an organized being which has already gone by.

"And straightway the damsel arose, and walked; for she was of the *age* of twelve years."—Mark v. 42.

3. The latter part of life; oldness.

"And there was one Anna, a prophetess, ... she was of a great *age* ..."—Luke ii. 36.

"Whatever poet, orator, or sage

May say of it, old *age* is still old *age*."

Longfellow: *Moriturus Salutamus*.

4. One of the stages of human life, as the ages of infancy, of youth, of manhood, or of womanhood, and of decline. [B. 1. *Physiol.*]

"And one man in his time plays many parts,
His acts being seven *ages*. At first, the infant,
Mewling and puking in the nurse's arms;
And then, the whining school-boy, with his satchel,
And shivering morning face, creeping like snail
Unwillingly to school; And then, the lover,
Sighing like furnace, with a woeful ballad
Made to his mistress' eyebrow: Then, a soldier,
Full of strange oaths, and bearded like the pard,
Jealous in honor, sudden and quick in quarrel,
Seeking the bubble reputation
Even in the cannon's mouth: And then, the justice,
In fair round belly, with good capon lined,
With eyes severe, and beard of formal cut,
Full of wise saws and modern instances,
And so he plays his part: The sixth *age* shifts
Into the lean and slipper'd pantaloon;
With spectacles on nose, and pouch on side;
His youthful hose well saved, a world too wide
For his shrunk shank; and his big manly voice,
Turning again toward childish treble, pipes
And whistles in his sound: Last scene of all,
That ends this strange eventful history,
Is second childishness and mere oblivion;
Sans teeth, sans eyes, sans taste, sans every thing."

Shakesp.: *As You Like It*, ii. 7.

5. The time at which man or any other organized being reaches maturity. (B., *Lav.*)

"But strong meat belongeth to them that are of full *age*, ..."—Heb. v. 14.

6. The time at which women cease to bear children.

"Through faith also Sara herself received strength to conceive seed, and was delivered of a child when she was past *age*."—Heb. xi. 11.

II. Of organized beings, viewed collectively:

1. The time required for a generation of mankind to pass away. [GENERATION.]

2. Those who are contemporaries on the earth at a certain time.

"Which in other *ages* was not made known unto the sons of men."—Eph. iii. 5.

"Yet I doubt not thro' the *ages* one increasing purpose runs,

And the thoughts of men are widen'd with the process of the suns."—Tennyson: *Locksley Hall*.

III. Of unorganized beings: The time during which an unorganized being has existed in the same state as the age of the moon, i. e., the time since it was new moon.

"As the moon gains *age*, ..."—Herschel: *Astron.*, 5th ed. (1858), § 417.

IV. Of time or duration in general:

1. A particular period of time marked by certain characteristics which distinguish it from others. Thus the Greeks and Romans imagined an age of gold, an age of silver, an age of brass, and an age of iron, Hesiod intercalating also before the fourth of these one of heroes.

"I venture one remark, however, upon Hesiod's very beautiful account of the *Ages*. ... Beginning with the Golden, he comes next to the Silver *Age*, and then to Brass. But instead of descending forthwith the fourth and last step to the Iron *Age*, he very singularly retraces his steps, and breaks the downward chain by an *Age* of Heroes. ... After this the scale drops at once to the lowest point, the Iron *Age*. ... the *age* of sheer wickedness and corruption."—Gladstone: *Studies on Homer*, i. 86.

[See also B., *Archeol.*]

"Those who compare the *age* on which their lot has fallen with a golden *age* which exists only in their imagination may talk of degeneracy and decay."—Macaulay: *Hist. Eng.*, ch. i.

"... in the literary *age* of Rome."—Lewis. *Early Rom. Hist.*, ch. v., § 13.

2. A century, one hundred years.

3. *Colloquially*: A long time, as "I have not seen you for an *age*."

"... and suffering thus, he made

Minutes an *age*."—Tennyson: *Geraint and Enid*.

B. Technically:

1. *Physiol.* If the word *age* be used in the now all but obsolete sense given under A., i. 4. i. e., as one of the stages of human life, then physiology clearly distinguishes six of these: viz., the periods of infancy, of childhood, of boyhood or girlhood, of adolescence, of manhood or womanhood, and of old age. The period of infancy terminates at two, when the first dentition is completed; that of childhood at seven or eight, when the second dentition is finished; that of boyhood or girlhood at the commencement of puberty, in temperate climates from the fourteenth to the sixteenth year in the male, and from the twelfth to the fourteenth in the female; that of adolescence extends to the twenty-fourth year in the male and the twentieth in the female; that of manhood or womanhood stretches on till the advent of old age, which comes sooner or later, according to the original strength of the constitution in each individual case, and the habits which have been acquired during life. The precise time of human existence similarly varies.

2. *Common Law*: The time of competence to do certain acts. In the male sex, fourteen is the age when partial discretion is supposed to be reached, whilst twenty-one is the period of full age. Under seven no boy can be capitally punished; from seven to fourteen it is doubtful if he can; at fourteen he may. At twelve a girl can contract a binding marriage; at twenty-one she is of full age. In medieval times, when a girl reached seven, by feudal custom or law, a lord might distrain his tenants for aid [Aid, B., 1] to marry, or rather betroth her; at nine she was dowable; at twelve she could confirm any consent to marriage which she had previously given; at fourteen she could take the management of her lands into her own hands; at sixteen she ceased, as is still the law, to be under the control of her guardian; and at twenty-one she might alienate lands and tenements belonging to her in her own right.

In the United States both males and females are of full age at twenty-one. The age at which minors may be punished or may marry varies in the several states.

***Age-prier, *age-prayer** (lit.=a praying of age): A plea put forth by a minor who has to defend an

Old Roman Law: A person related to another through males only. He was contradistinguished from a cognate, in the connecting line of whose kinship to a second person one or more females had been interposed. Thus a brother's son is his uncle's agnate, because the short line of connection between them can be constituted by males only; while a sister's son is his cognate, because there is a female in the chain of descent. By the law of the twelve tables only agnates possessed the rights of family and succession, the cognates of every rank being disinherited as strangers and aliens. Justinian wholly abolished the distinction between agnates and cognates. (*Mackenzie: Rom. Law*, 1870, ch. ix.)

"The question which now supersedes the agrarian movement in importance, is the proposal for a code of written laws made by the tribune Terentillus."—*Lewis: Early Rom. Hist., ch. xii., pt. iii., § 36.*

The Agrarian Laws, in the ancient Roman republic, were laws of which the most important were those carried by C. Licinius Stolo, when tribune of the people, in B. C. 367. The second rogation, among other enactments, provided (1) that no one should occupy more than 500 *jugera* (by one calculation about 280, and by another 333, English acres) of the public lands, or have more than 100 large and 500 small cattle grazing upon them; (2) that such portion of the public lands above 500 *jugera* as was in possession of individuals should be divided amongst all the plebeians, in lots of 7 *jugera*, as property; (3) that the occupiers of public land were bound to employ free laborers, in a certain fixed proportion to the extent of their occupation. When at a later period efforts were made to revive the Licinian rogations, such opposition was excited that the two Gracchi lost their lives in consequence, and this, with their other projects, proved abortive. It is important to note that the land with which the Licinian or "agrarian" laws dealt was public land belonging to the state, and not, as is popularly supposed, private property.

"The real opposition to an agrarian law arose from those who, by occupying the unappropriated land of the state, and employing their capital and slaves in its cultivation, had acquired a possessory right to it."—*Lewis: Early Rom. Hist., ch. xii., pt. ii., § 26.*

It is also cognate with the Goth. *akrs*, the Ger. *acker*, and the Eng. *acre*.] Essential meaning=earth tilt, earth tillage. (*Beames: Early England*.)

1. In a general sense: The art of cultivating the ground, whether by pasturage, by tillage, or by gardening. In many countries the process of human economical and social development has been from the savage state to hunting and fishing, from these to the pastoral state, from it again to agriculture properly so called, and thence, finally, to commerce and manufactures; though even in the most advanced countries every one of the stages now mentioned, excepting only the first, and in part the second, still exist and flourish. The tillage of the soil has existed from a remote period of antiquity, and experience has from time to time improved the processes adopted and the instruments in use; but it is not till a very recent period that the necessity of basing the occupation of the farmer on physical and other science has been even partially recognized. Now a division is made into *theoretical* and *practical* agriculture, the former investigating the scientific principles on which the cultivation of the soil should be conducted, and the best methods of carrying them out; and the latter actually doing so in practice.

The soil used for agricultural purposes is mainly derived from subadjacent rocks, which cannot be properly understood without some knowledge of geology, while a study of the dip and strike of the rocks will also be of use in determining the most suitable directions for drains and places for wells. The composition of the soil, manures, &c., requires for its determination agricultural chemistry. The weather cannot be properly understood without meteorology. The plants cultivated, the weeds requiring extirpation, the fungous growths which often do extensive and mysterious damage, fall under the province of botany; the domestic animals, and the wild mammals, birds, and insects which prey on the produce of the field, under that of zoölogy. The complex machines and even the simplest implements are constructed upon principles revealed by natural philosophy; farm-buildings cannot be properly planned or constructed without a knowledge of architecture. Rents can be understood only by the student of political economy. Finally, farm-laborers cannot be governed or rendered loyal and trustworthy unless their superior knows the human heart, and acts on the Christian principle of doing to those under him as he would wish them, if his or their relative positions were reversed, to do to him. ā-gūe, **ā-gew*, **āg'-wē*, **hā'-gē*, *s.* [Skinner and Johnson, whom Wedgwood follows, take this from Fr. *aigu*=sharp, acute; in Sp. & Port. *agudo*. The primary meaning would then be an "acute" fever. Serenius and Tooke derive it from Goth. *agis*=trembling. Webster is of the same opinion, and cites as cognate words A. S. *æge*, *ege*, *oga*, *hoga*=fear, dread, horror; Arm. *hegen*=to shake; Irish *agle*=fear. "The radical idea," he says, "is a shaking or shivering similar to that occasioned by terror."]

**I. Originally, in a general sense*: Any sharp fever.

"But Ihesu thorgh his myght, blissed mot he be,
Reised him vpright, and passed that *hage*."

R. Brunne, p. 333.

II. Hence in a limited sense:

1. An intermittent fever, in whatever stage of its progress or whatever its type. A person about to be seized by it generally feels somewhat indisposed for about a fortnight previously. Then he is seized with a shivering fit, which ushers in the cold stage of the disease. This passes at length into a hot stage, and it again into one characterized by great perspiration, which carries off the disorder for a time. The three leading types of ague are the *quotidian*, with an interval of twenty-four hours; the *tertian*, with one of forty-eight hours; and the *quartan*, with one of seventy-two hours. The remote or the proximate cause of ague is generally the exposure of the body to the malaria generated in marshes. The remedy is quinine or some other anti-periodic. [ANTI-PERIODIC.] [MALARIA.]

"And he will look as hollow as a ghost,

As dim and meagre as an *ague's* fit."

Shakesp.: King John, iii. 4.

2. *Specially*:

(a) *Lit.*: The cold fit, often accompanied by trembling or shaking, which constitutes the first of the three stages of intermittent fever. In the phrase "fever and ague," ague means the cold stage, and fever the hot one which succeeds it.

"Cold, shivering *ague*."

Dryden: Palamon and Arcle.

(b) *Fig.*: Any shaking produced by cold, however removed it may be from the first stage of intermittent fever.

III. As the rendering of a word of doubtful meaning:

The ague of Scripture. The Hebrew word *qad-dachhath*, Lev. xxvi. 16, which is translated "fever" in Deut. xxviii. 22, from the root *qaddachh*=to set on fire, is rendered in the Septuagint in *Leuiticus* *ikteros*=the jaundice, and in Deut. *puretos*=fever, especially of a tertian or quartan type. Probably a more formidable disease is meant than simple ague, or the word may be used in the extended sense of No. I.

"I also will do this unto you; I will even appoint over you terror, consumption, and the burning *ague*, that shall consume the eyes, and cause sorrow of heart: . . ."

—*Lev. xxvi. 16.*

I. Natural Philosophy and Chemistry:

*1. *Formerly:* Any gas, whatever its composition.

"The division of bodies into *airs*, liquids, and solids."
—*Herschel: Study Nat. Philos.* (1831), *Lardner's Cyclop.*, p. 228.

**Dephlogisticated air*=oxygen gas.

**Fixed air*=carbonic acid gas.

**Inflammable air*=hydrogen gas.

**Phlogisticated air*=nitrogen gas.

2. *Now:* The gaseous substance which fills the atmosphere surrounding our planet. It is elastic, and is destitute of taste, color, and smell. It contains by weight, oxygen 23.10 parts, and of nitrogen 76.90; and by volume, of oxygen 20.90, and of nitrogen 79.10; or of 10,000 parts there are in perfectly dry air, of nitrogen 7,912, oxygen 2,088, carbonic acid 4, carbureted hydrogen 4, with a trace of ammonia. But air never is dry; it has always in it a varying amount of watery vapor. When exhaled from the lungs it is saturated with moisture, and contains about 4.35 parts of carbonic acid. Besides the above named gases, recent investigations conducted by Lord Rayleigh and Professor Ramsay, of England, prove that air contains at least four heretofore undetected elements, named, respectively, *argon*, *crypton*, *metargon*, and *neon*. See these names.

The density of air being fixed at the round number 1,000, it is made the standard with which the specific gravity of other substances is compared. If water be made unity, then the specific gravity of dry air is .0012759. At 62° Fahr. it is 810 times lighter than water, and 11,000 times lighter than mercury. At the surface of the sea the mean pressure is sufficient to balance a column of mercury 30 inches, or one of water 34 feet in height. [ATMOSPHERE, ACOUSTICS, BAROMETER, PNEUMATICS, RESPIRATION.] See LIQUID AIR.

II. Music: A tune or melody. A melodie succession of notes as opposed to a harmonic combination. [TUNE, MELODY.]

"There is in souls a sympathy with sounds,
And as the mind is pitch'd the ear is pleased
With melting *airs* or martial, brisk or grave."
Cowper: Task, bk. vi.

fāte, fāt, fāre, amidst, whāt, fāl, father; wē, wēt, hēre, camēl, hēr, thēre; pīne, pīt, sīre, sīr, marine; gō, pōt, or, wōre, wōlf, wōrk, whō, sōn; mūte, cūb, cūre, unite, cūr, rūle, fūll; trŷ, Sŷrian. æ, œ = ē; ey = ā. qu = kw.

¶ Formerly, harmonized melodies were said to be airs in several parts, but the term is at present generally restricted to an unaccompanied tune, or the most prominent melody of a composition, as found usually in the highest part, whether in vocal or instrumental music.

III. *Painting & Sculpture*: Gesture, attitude; that which expresses the character of the action represented.

"Or great, extracted from the fine antique;
In attitude, expression, *airs* divine."

Thomson: *Liberty*, pt. iv.

IV. *Horsemanship* (*plur.*): The artificial motion of a horse under direction.

air-atmosphere, *s.* The atmosphere consisting of or filled with air.

"... the lofty *air-atmosphere*."—Prof. Airy on *Sound* (1868), p. 8.

air-balloon, *s.* (1) Properly a balloon rendered lighter than the surrounding atmosphere by the rarefaction of the air within it; but (2) the word "air" may be used in the old sense for any gas, and the term "air-balloon" thus becomes simply a synonym for BALLOON (*q. v.*).

"*Air-balloons* are hollow spheres made of some light impermeable material, which, when filled with heated air, with hydrogen gas, or with coal gas, rise in the air in virtue of their relative lightness."—Atkinson: *Ganot's Physics* (3d ed., 1868), § 169.

air-bath, *s.* A method of drying bodies by exposing them to air of any required temperature.

air-bed, *s.* A "bed" or mattress made of air-tight cloth or vulcanized india-rubber, divided into compartments and inflated with air. Its disadvantage is that the air within it becomes heated by the warmth of the body. In this respect it is inferior to the water-bed, which is now generally used instead of it as an easy couch for the sick.

air-bladder, *s.* [Eng. *air*; *bladder*.]

I. *Ord. Lang.*: Any bladder filled with air.

II. *Physiology*:

1. *Gen.*: Any bladder or sac occurring in an animal or plant.

"The pulmonary artery and vein pass along the surfaces of these *air-bladders* in an infinite number of ramifications."—Arbuthnot on *Aliments*.

2. *Spec.*: Another name for the swimming bladder in a fish. [SWIMMING BLADDER.]

"... a bladder usually double, known by the name of *air-bladder*, and which is generally placed above the abdominal viscera."—Gregory Haüy: *Nat. Phil.* (London, 1807), § 68.

"... the earliest trace of warm-blooded, *air-breathing* viviparous quadrupeds."—Owen: *British Fossil Mammals and Birds*, p. xiii.

air-bugs, *s. pl.* [Eng. *air*; *bugs*.]

Entom.: The English equivalent of Aurocorisæ, the name given to the Geocores, or Land-bugs, a tribe or section of the sub-order Heteroptera. [AUROCORISA, GEOCORES, LAND-BUGS.]

air-built, *a.* Built in the air or of air; constructed of baseless hopes by a wayward fancy; chimerical.

"Hence the fool's paradise, the statesman's scheme,
The *air-built* castle, and the golden dream."

Pope: *Dunciad*.

air-cells, **air-sacs**, *s.*

Animal Physiol.: Certain cells existing in masses in the lungs, where they surround and terminate each lobular passage. In man they are but $\frac{1}{16}$ of an inch in diameter; in the other mammals they are also very small. In birds they are not merely distributed over the chest and the abdomen, but

they penetrate the quills, and in birds of powerful flight even the bones. They communicate with the lungs, afford a great extension to the surface with which the air inhaled comes in contact, and in consequence increase the heat and muscular energy of the bird, while at the same time diminishing its specific gravity. In insects some branches of the tracheæ dilate into air-receptacles, the number and size of which, like the air-cells in birds, are in direct relation with the powers of flight. (See Owen's *Invertebrata*, Lect. xvii.)

"On the exterior of a lobule [of the lungs] we observe bubbles of air of various sizes in its tissue; and if the bronchial tubes be injected the lobule is distended, and its exterior presents a number of bulgings known as the *air-cells*, about which much controversy has existed."—Todd & Bowman: *Physiol. Anat.*, ii. 388, 389.

**Veg. Physiol.*: An old and erroneous name still popularly given to certain intercellular spaces which contain air, and are not receptacles of secretion. They are called by Link *lacunæ*. They vary in size, figure, and arrangement. In water-plants they are designed to enable the plant to float in the stems of Grasses, Umbelliferæ, &c. They are caused by one part growing more quickly than another.

Air-cells.

1, 2, 4. Sections of leaves. 3. Section of pith of a rush.

air-chamber, *s.*

Mech.: One of the chambers in a suction and force-pump. [PUMP.] (Atkinson: *Ganot's Physics*, 3d ed., § 185.)

In the plural. *Veg. Physiol.*: The same as AIR-CELLS (*q. v.*).

air-condenser, *s.* Any machine for rendering air more dense by subjecting it to pressure. The principle is that of a syringe driving air into a close vessel till the required degree of condensation is produced.

air-current, *s.* A current of air.

air-elasticity, *s.* The elasticity of the air.

air-engine, **caloric engine**, *s.* Any engine which has for its moving power heated air, that is, which employs air, like steam in a steam-engine, as a medium for transforming heat into mechanical energy. The best known air-engines have been those of the Rev. Dr. Stirling in 1816, Capt. Ericsson in 1833, and Mr. Philander Shaw in 1867. As yet they have been very partially successful. Were they so they would have this advantage among others over steam-engines, that air can with safety be raised to a higher temperature than steam, and therefore can generate a higher amount of mechanical energy.

air-escape, *s.* A contrivance for permitting the escape of the air which tends to accumulate till it obstructs the progress of the water in pipes led over a rising ground. It consists of a hollow vessel, having in its top a ball-cock, so adjusted that when air collects in the pipes it ascends into the vessel, and, displacing the water, causes the ball to descend till it opens the cock and allows the air to escape.

air-flue, *s.* A flue for conveying air to various parts of a building.

air-fountain, *s.* A fountain in which the moving power designed to raise the water in a jet is air condensed within a vessel.

air-gossamer, *s.* [AIR-THREADS.]

air-gun, *s.* An instrument designed to propel balls by the elastic force of condensed air. A strong metal globe is formed, furnished with a small hole and a valve opening inward. Into this hole a con-

densing syringe is screwed. When, by means of this apparatus, the condensation has been brought to the requisite point of intensity, the globe is detached from the syringe and screwed at the breech of a gun, so constructed that the valve may be opened by means of a trigger. A ball is then inserted in the barrel near the breech, so fitting it as to render it air-tight, and the trigger being pulled, the elasticity of the condensed air impels it with considerable force. A piece of simple mechanism may supply the barrel with ball after ball, and thus make re-loading after a discharge easy and rapid.

Air-gun.

air-holder, *s.* An instrument for holding air for the purpose of counteracting the pressure of a decreasing column of mercury.

air-hole, *s.* An opening to admit the ingress or egress of air.

air-jacket, *s.* A jacket having air-tight bladders or bags designed to be inflated, with the view of supporting the person wearing it in the water.

air-line, *s.* A direct railroad route.

air-line wire, *s.* In telegraphy the portion of the line wire which is strung on poles and carried through the air.

air-lock, *s.* An air-tight apartment in a submerged caisson, used for the purpose of allowing the entrance and exit of men and materials. After entrance into the apartment from the main shaft the door is closed, and the air of the apartment is compressed before opening the door leading to the condensed-air chambers where the men work.

air-pipe, *s.* A pipe connecting the hold of a vessel with the furnace of a ship, and designed to convey the foul air of the hold to the furnace that it may be burned. That this purpose may be effected, no air is allowed to reach the furnace for combustion excepting that of the hold supplied by the air-pipe.

air-plant, **aërial plant**, *s.* A plant which is capable of deriving its nutriment for a certain limited period from the air. The chief genera to which the name has been applied are *Aërides*, *Vanilla*, and *Sarcanthus*, all Orchids. [AERIDES.]

air-poise, *s.* [Eng. *air*; *poise*.] An instrument for measuring the weight of the air.

air-pressure engine, *s.* An engine in which the moving power is produced by the pressure of air of different densities.

air-pump, *s.* An instrument invented by Otto von Guericke of Magdeburg, in 1650. It was de-

signed to exhaust the air from a receiver, but in reality it can do no more than reduce it to a high degree of rarefaction. The air-pump now generally in use is a considerable improvement on that of Guericke. A bell-formed "receiver" of glass is made to rest on a horizontal plate of thick glass ground perfectly smooth. In the center of that plate, under the receiver, is an opening into a tube which, passing for some distance horizontally, ultimately branches at right angles into two portions, entering two upright cylinders of glass. The cylinders are firmly cemented to the glass plate, and within them are two pistons fitting them so closely as to be air-tight. Each piston is worked by a rack and pinion, turned by a handle; while each cylinder is fitted with a valve, so contrived that when the piston is raised, communication is opened between the cylinder and the receiver, which communication is again closed as the piston falls. It is evident that when any one

boil. bov: pout, jowl; cat, cell, chorus, chin, bench; go, gem; thin, this; sin, as; expect, Xenophon, exist. ph = f. -cian, -tian = shan. -tion, -sion = shün; -tion, -sion = zhün. -tious, -cious, -sious = shüs. -ble, -dle, &c. = bel, del.

commences to work the machine, the air in the cylinders will be immediately expelled the first upward motion that they are made to take. The valve will then fly open, and the air from the receiver will fill both the cylinders as well as itself, though, of course, now in a somewhat rarefied state. As the same process is again and again repeated, the air will become increasingly rarefied, though, as stated above, an actual vacuum never can result from the action now described.

Bianchi's air-pump is an improvement on the common one. It is made of iron, and has but one cylinder. It can be made larger than the common machine, and produces a so-called vacuum more quickly. It is described in *Ganot's Physics*, Atkinson's translation.

Sprengel's air-pump is a form of air-pump of a totally different kind from the ordinary one. It depends on the principle of converting the space to be exhausted into a Torricellian vacuum. (*Ibid.*, pp. 144, 145.) [VACUUM.]

Condensing air-pump, or condensing pump. [CONDENSING.]

Air-pump gauge: A gauge for testing the extent to which the air has been exhausted in the receiver of an air-pump. It consists of a glass tube bent like a syphon. One leg is closed, as in a barometer, the other open. It is placed under a small bell-jar communicating by a stop-cock with the receiver, and the more nearly the mercury stands at the same level, the more nearly has a vacuum been produced.

Air-pump of a condensing steam-engine: The pump which draws the condensed steam, with the air commingled with it, and the condensed water from the condenser, and casts them into the hot well.

air-sac, air-sack, s. [Eng. *air*; *sac*, *sack*.] [AIR-CELLS.]

"The bronchial tubes [in birds] open upon the surface of the lungs into *air-sacs*, which differ in number and in development in different birds."—*Huxley: Classif. of Animals*, xxvii., "Aves."

"The *air-sacks* on each side of the mouth of certain male frogs."—*Darwin: Descent of Man*, vol. ii., chap. xiii.

air-shaft, s. A hole bored from the surface of the earth to some portion of the galleries of a mine for the purpose of ventilation. There should always be two—one, with a furnace under it, for vitiated air to ascend; the other, with no furnace, for pure air to descend. If there be but one, it requires to be divided longitudinally into two passages—the one for the ascending, and the other for the descending air.

"By the sinking of an *air-shaft* the air hath liberty to circulate and carry out the steams both of the miners' breath and the damps, which would otherwise stagnate there."—*Ruy.*

By blasts of strong *air-stirring* Northern wind."
May's Lucan, bk. vi.

air-stove, s. A stove, the heat of which is employed to warm a stream of air directed against the surface, which air is then admitted to the apartment of which the temperature is to be raised. The stove is enclosed in a casing somewhat larger than itself, so as to leave a space of a few inches between the two. At the lower part of the casing is an aperture fitted with a register to regulate the admission of the air, and at the upper part is a similar opening to allow of its exit into the apartment.

air-thermometer, s. An instrument which is designed to measure the degrees of heat by means of the expansion of air. When used to measure small differences of temperature, it is a capillary tube with a bulb at the upper end, and with its lower end plunged into a colored liquid in a bottle. The air in the bulb at the top is heated, so as to cause a portion of it to be expelled, leaving the colored liquid free to rise a certain distance in the tube. An alteration of temperature will then make the remainder of the air in the tube to expand or contract with the effect of making the liquid correspondingly fall or rise in the tube. Within certain limits, it is a delicate thermometer, and was the first form of that instrument, as invented in 1590, by Santorio, a physician of Padua. It can measure only the lower temperatures. When employed to note higher degrees of heat, a bent capillary tube is substituted for the straight one. It agrees with the mercurial thermometer up to 260°, but above that point mercury expands relatively more than air. The differential thermometer is a modification of the air-thermometer. [DIFFERENTIAL THERMOMETER.]

Kinnersley's electric air-thermometer: An instrument consisting of a glass tube, closed at both ends

by air-tight brass caps, through which two wires slide in the direction of the axis of the tube. These wires are terminated by brass balls, which are made to approach within the striking distance. To an aperture in the bottom of the lower cap is fitted a bent tube of glass, which turns upward, and is open at both ends; the bend is filled with mercury, or with a colored fluid, which may indicate by its rising or falling within the tube any dilatation or contraction that may take place in the air within the vessel. Every time a spark passes between the brass balls the fluid suddenly rises, but descends again to its old level immediately after the explosion.

air-threads, or air-gossamers, s. The name given to the long slender filaments often seen in autumn floating in the air. They have been darted out by spiders, especially the *Aranea obteatrix*, which, mounting to the summit of a bush or tree, darts such threads out till it succeeds in launching one strong enough to support it, and float it up into the air, which it desires to ascend in quest of prey.

air-threatening, a. Threatening the air; lofty.
"As from *air-threatening* tops of cedars tall."
Mirror for Magistrates, p. 563.

air-tight, a. So tight as to prevent the passage of the air. (Used of a bottle or tube hermetically sealed.)
" . . . which close the cylinder *air-tight*."—*Tyndall: Heat*, 3d ed., p. 303.

air-trunk, s. A pipe or shaft for conducting foul or heated air from a room.

air-tube, s.

" . . . the powerful air-pumps (driven by large steam-engines), which were used to exhaust the *air-tubes* upon the Atmospheric Railway."—*Airy: Sound* (1868), p. 18.

2. *Physiol.*: A tube or pipe in an organized being, designed for the reception or passage of air. The term is often used for the tracheæ of insects—tubes which pervade the bodies of these animals, as arteries and veins do our own, but with this essential difference, that they carry air instead of a circulating fluid; the arrangement in insects being that "the air is distributed by a vascular system over the reservoirs of blood, instead of the blood being distributed by a capillary network over a reservoir of air." (*Owen: Invertebrata*, § xvii.)

" . . . that series of air-cells associated by dependence on a single terminal *air-tube*."—*Todd & Bowman: Phys. Anat.*, vol. ii., p. 388.

"By this structure the most delicate and invisible ramifications of the *air-tubes* may be easily recognized under the microscope."—*Owen: Invertebrata*, § xvii.

"The *Physophora* float by many smaller *air-vesicles*."—*Owen: Invertebrata*, Lect. ix.

air-vessel, s.

1. *Hydraul.*: A vessel in which air is condensed by pressure, in order that when released its elasticity may be employed as a moving or regulating power. Such a vessel is used in a forcing pump to render the discharge of water continuous instead of intermittent.

2. *Animal Physiol.*: Any vessel containing air; specially one of the tubes, or tracheæ, through which air for the purpose of respiration is conveyed into the bodies of insects. [AIR-TUBE.]

3. *Veg. Physiol.*: The spiral vessels, one main function of which is believed to be to convey air, charged with an unwonted proportion of oxygen gas, to the interior of plants.

1. *Specifically*: A sect which is believed to have sprung from the old Paulicians [PAULICIANS] of Bulgaria, and which received the further names of Bulgarians, or Bougres; Publicani, or Popolicani (Pauliciani corrupted); *Cathari*, meaning pure; and *Los Bos Homos*, signifying good men. They are supposed to have arrived in Italy from the East in the eleventh century, and in the twelfth they spread to the south of France. In most respects they held primitive Scripture doctrine, though, in the opinion of many, with a tinge of Manichæism. They had the courage to carry out their religious convictions when the Church of Rome was in the plenitude of its power.

2. *In a more general sense*: All the so-called heretics in Languedoc, whatever their origin, who imitated the Albigenses in casting off the authority of the Church of Rome. Against these of every name a crusade was let loose by Innocent III. in A. D. 1209, and when it had done its work the further suppression of the sect was handed over to the Inquisition. case of white mice and white rabbits; it occurs, however, occasionally, though not very frequently, in the human race, especially among the darker colored varieties or sub-varieties of mankind. The isthmus of Darien and Africa have been mentioned as special localities for it. A human albino has the skin preternaturally fair. The hairs on his head and body are white. The *pigmentum nigrum* is deficient in the eyes, and these organs have a pinkish appearance, produced by the visibility of the blood in the choroid and iris; moreover, they are painful when exposed to light of even the ordinary intensity.

āl-bū'-mēn, āl-bū'-mīn, s. [Lat., whence Fr. *albumine*, Port. *albumina*, Ital. *albume*.]

1. *Chem.*: The name of a class of Albuminoids (q. v.) that are soluble in water, as *serum* (q. v.) and *egg albumen*. Egg albumen differs from serum by giving a precipitate when agitated with ether; it is scarcely soluble in strong nitric acid; its specific rotation is 35°50' for yellow light. The white of eggs is composed of this substance; it dries up into a light yellow gum-like substance, which will not putrefy. It is converted into coagulated albumen by heating the fluid albumen to 72° C. It contains sulphur, and blackens a silver spoon. It is precipitated by strong acids. It is an antidote in cases of poisoning by corrosive sublimate or copper salts.

Coagulated albumin is obtained by heating neutral solutions of albumin, fibrin, &c., to boiling, or by the action of alcohol, also by heating precipitated albuminates or casein. It is insoluble in water, alcohol, and scarcely in dilute potash, but dissolves in acetic acid; by the action of caustic potash it is converted into albuminate. Pepsin and HCl (hydrochloric acid), at blood-heat, convert it into *syntonin*, and then into *peptone*.

Derived albumins are insoluble in water, and in solutions of NaCl (sodium chloride), but soluble in dilute acids and alkalies. There are acid albumins and alkali albumins.

Acid albumin is formed by adding a small quantity of dilute HCl (hydrochloric acid) to serum or egg albumen, and gradually raising the temperature to 70°; it does not coagulate, and the rotation to the left is increased to 72°. By neutralizing the liquid, a white flocculent precipitate is obtained insoluble in water, but soluble in alkali and in dilute solutions of alkaline carbonates.

Alkali albumin, or *albuminate*, is obtained by adding very dilute caustic alkali, heating the liquid, and precipitating with acids. It closely resembles the casein of milk. Potassium albuminate is also called *protein*.

2. *Bot.*: A substance interposed between the embryo and the testa of many plants. It is sometimes soft and fleshy, and at other times hard. It varies greatly in amount in those plants in which it is present, being particularly large in some endogens, such as the cocoanut, in which it constitutes the eatable part of the fruit.

3. *Phot. Albumen Process*: A process by which albumen is used instead of collodion to coat glass or paper. A method of doing this in the case of glass was published by M. Nièpce de Saint Victor in the *Technologist* for 1848. It was subsequently improved by M. le Gray. The foreign transparent stereoscopic views were at one time obtained by the use of albumen in the way now described.

Chem.: A name given to certain chemical substances which occur in the animal and vegetable tissues. They are amorphous, and their chemical constitution has not yet been discovered. They contain about 54 parts of carbon, 7 of hydrogen, 16 of nitrogen, 21 of oxygen, and 1 to 1½ of sulphur. They are dissolved by acetic acid and strong mineral acids; nitric acid converts them into xanthoproteic acid; caustic alkalies decompose them, forming leucine, tyrosine, oxalic acid, and ammonia. They are divided into the following classes: (1) **ALBUMINS**, soluble in water; as *serum* and *egg albumen*. (2) **GLOBULINS**, insoluble in water, soluble

in very dilute acids and alkalies, soluble in a solution—one per cent.—of NaCl (sodium chloride), as *myosin*, *globulin*, *fibrinogen*, *vitellin*. (3) **DERIVED ALBUMINS**, insoluble in water and in solutions of NaCl (sodium chloride), soluble in dilute acids and alkalies; as *acid albumin*, *alkali albumins*, or *albuminates*, as casein. (4) **FIBRIN**, insoluble in water, sparingly soluble in dilute acids and alkalies, and in neutral saline solutions; as *fibrin* and *gluten*. Hermes Trismegistus is mentioned as one of the earliest alchemists, but the work on the subject attributed to him is spurious. Geber, an Arabian physician, who lived in the seventh century, is another early alchemist, but the genuineness of his works has been doubted. A German, Albert Groot, or Albertus Magnus, born in 1205; the celebrated Thomas Aquinas, born in 1227; Raymond Lully, born in 1235; the illustrious Friar Bacon, born in 1314; Arnoldus de Villa Nova, born in 1240, were all known as alchemists. A number of similar inquirers arose in the fourteenth century, and Basil Valentine, an excellent chemist for his age, in the fifteenth, after which there were fewer, and now it would be difficult to find even one. A. Literally:

1. A study of nature with three special objects: (1) that of obtaining an *alkahest*, or universal solvent; (2) that of acquiring the ability to transmute all metals into gold or silver, especially the former; (3) that of obtaining an *elixir vite*, or universal medicine which might cure all diseases and indefinitely prolong human life. These objects were all desirable, and it could not be known *a priori* whether or not they were attainable. To take the transmutation of metals, the substances at present classed as simple elements may not always remain in that category; at any moment one may be found to be a compound of other substances, and require to be taken out of the list. The possibility of this becomes greater when it is remembered that not merely do allied metals generally occur in nature together, but there is also a definite relation between their atomic weights. The means adopted in the pre-scientific age, when alchemy most flourished [ALCHEMIST], were more open to ridicule than the objects aimed at. To achieve success in the study it was thought needful for one to obtain first the "philosopher's stone," described as a red powder with a peculiar smell. A skilled alchemist was called an "adept." In all ages scientific intellects are brought into being, and many "adepts" were the physical philosophers of the age. Though they failed in their immediate objects, they discovered the sulphuric, nitric, and muriatic acids, and laid the foundations of the noble science of modern chemistry. Others were pseudo-scientists and impostors who pretended that they really had made gold: by means of men of this latter type alchemy gradually sank in reputation, and ultimately became an object of ridicule to real scientific inquirers and to the civilized world at large.

"Astrology and alchemy became jests."—*Macaulay*: *Hist. Eng.*, ch. iii.

2. A mixed metal from which spoons, kitchen utensils, and trumpets were formed. The name was given because it was supposed to have been made by some of the processes of alchemy.

† It is called in Scotch *alcomye*, and in Old English sometimes *alcamayne*.

"Bell-metal, &c., and the counterfeit plate, which they call alchemy."—*Bacon*: *Physiol. Rem.*

"Then, of their session ended, they bid cry
With trumpets' regal sound the great result:
Toward the four winds four speedy cherubim

Milton: *P. L.*, bk. ii.

† Properly speaking, there were two kinds of "alchemy" in this sense—the *white* and the *red*.

"White alchemy is made of pan-brass one pound, and arsenicum three ounces."—*Bacon*: *Phys. Rem.*, § 6.

"Red alchemy is made of copper and auri pigment."—*Ibid.*, § 7.

B. *Organic Chem.*: Alcohol is the name given to a class of compounds differing from hydrocarbons in the substitution of one or more hydrogen atoms by the monatomic radical hydroxyl (OH)'. Alcohols are divided into monatomic, diatomic, triatomic, &c., according as they contain 1, 2, or 3 atoms of H (hydrogen), each replaced by (OH)'. Alcohols may also be regarded as water in which one atom of H is replaced by a hydrocarbon radical. Alcohol can unite with certain salts, as alcohol of crystallization. The O in $\frac{H}{H} \left\{ \begin{matrix} O \\ H \end{matrix} \right\}$ (water) can

be replaced by S (sulphur), as $\frac{H}{H} \left\{ \begin{matrix} S \\ H \end{matrix} \right\}$ (hydrogen sulphide); so in alcohol, $\frac{C_2H_5}{H} \left\{ \begin{matrix} O \\ H \end{matrix} \right\}$, forming mercaptan, $\frac{C_2H_5}{H} \left\{ \begin{matrix} S \\ H \end{matrix} \right\}$. Alcohol may also be compared

with acids, as $\frac{Cl}{H} \left\{ \begin{matrix} O \\ H \end{matrix} \right\}$ (hypochlorous acid), $\frac{C_2H_5}{H} \left\{ \begin{matrix} O \\ H \end{matrix} \right\}$ (alcohol); the H can be replaced by K or Na, as $\frac{Cl}{Na} \left\{ \begin{matrix} O \\ H \end{matrix} \right\}$ (sodium hypochlorite), and $\frac{C_2H_5}{Na} \left\{ \begin{matrix} O \\ H \end{matrix} \right\}$ (sodium ethylate), therefore it can be considered as a weak acid. Also it can be compared with bases, as $\frac{K}{H} \left\{ \begin{matrix} O \\ H \end{matrix} \right\}$ (potassium hydrate) with acids forms salts

and water. As $KHO + HCl = KCl$ (potassium chloride) and H_2O (water), so alcohol and acids form acid ethers and water: $\frac{C_2H_5}{H} \left\{ \begin{matrix} O \\ H \end{matrix} \right\} + \frac{H}{Cl} \left\{ \begin{matrix} O \\ H \end{matrix} \right\}$ (hydrochloric

acid)= H_2O and $C_2H_5.Cl$ (ethyl chloride). An alcohol is said to be *primary*, *secondary*, or *tertiary*, according as the carbon atom which is in combination with hydroxyl (OH) is likewise directly combined with one, two, or three carbon atoms. The hydrocarbon radicals can also have their carbon atoms linked together in different ways, forming isomeric alcohols. [AMYL ALCOHOL.] Primary alcohols, by the action of oxidizing agents, yield *aldehydes*, then acids; secondary alcohols, by oxidation, yield *ketones*; tertiary alcohols, by oxidation, yield a mixture of acids. Alcohols derived from benzol, or its substitution compounds, are called *aromatic alcohols*; they contain one or more benzol rings. [See BENZENE.]

ethyl alcohol (commonly called alcohol), ethylic alcohol, methyl carbinol, spirits of wine, ethyl hydrate, *s.*,

Chem.: Pure ethyl alcohol, also called *absolute alcohol*, is obtained by distilling the strongest rectified spirit of wine with half its weight of quicklime. Pure alcohol is a colorless, limpid liquid, having a pungent, agreeable odor and a burning taste. Its specific gravity at 0° is 0.8095, and at 15.5° is 0.7938, its vapor referred to air 1.613. It is very inflammable, burning with a pale blue, smokeless flame. It boils at 78.4° when anhydrous. It becomes viscid at -100°. It mixes with water in all

proportions, with evolution of heat and contraction of volume; and it readily absorbs moisture from the air, and from substances immersed in it. Chlorine converts alcohol into *chloral*, $C_2H_5Cl_3O$, but in the presence of alkalis into *chloroform*, $CHCl_3$. By oxidation alcohol is converted into *aldehyde*, C_2H_4O , then into *acetic acid*, $C_2H_4O_2$. The alkaline metals replace one atom of H, forming C_2H_5NaO (sodium ethylate). Strong H_2SO_4 (sulphuric acid) forms with alcohol (C_2H_5) $H.SO_4$, *sulphovinic acid*. HCl (hydrochloric acid) with alcohol yields ethyl chloride, C_2H_5Cl , and water. Alcohol can be formed by synthesis from the elements, C, H, O: thus acetylene, C_2H_2 , can be formed by passing an electric current in an atmosphere of H between carbon points; this is converted by nascent H into olefiant gas, C_2H_4 , which is absorbed by H_2SO_4 (sulphuric acid); by diluting with water, and distilling, alcohol is obtained. Alcohol is used as a solvent for alkaloids, resins, essential oils, several salts, &c. Alcohol is obtained by the fermentation of sugars, when a solution of them is mixed with yeast, *Mycoderma cerevisiae*, and kept at a temperature between 25° and 30°, till it ceases to give off CO_2 (carbonic acid gas). It is then distilled. Proof spirit contains 49.5 per cent. of alcohol, and has a specific gravity of 0.9198 at 60° F. Methylated spirit contains 10 per cent. of wood spirit in alcohol of sp. gr. 0.830; it is duty free, and can be used instead of spirits of wine for making chloroform, olefiant gas, varnishes, extracting alkaloids, and for preserving anatomical preparations, &c. Wines contain alcohol; port and sherry, 19 to 25 per cent.; claret and hock and strong ale, about 10 per cent.; brandy, whisky, gin, &c., about 40 to 50 per cent. These liquids owe their intoxicating effects to the alcohol they contain.

āl'-dē-hŷ'-des, s. [Contraction from Med. Lat. *alcohol dehydrogenatus*=alcohol dehydrogenated, i. e., deprived of hydrogen.]

Chem.: Aldehydes are formed by the oxidation of alcohols, and are re-converted into alcohols by the action of nascent hydrogen; by further oxidation they are converted into acids. They differ from alcohols in having two atoms less of hydrogen, which are removed from the carbon atom containing the radical HO' (hydroxyl) connected to it in the alcohol; thus the aldehyde monatomic radical is $(O=C-H)'$. The carbon atom having two bonds united to an atom of oxygen, and another to an atom of hydrogen, the fourth is united to a monatomic hydrocarbon radical, or hydrogen. From monatomic alcohols only one aldehyde can be formed; from a diatomic alcohol there may be formed a diatomic aldehyde containing the radical $(OCH)'$ twice, or an alcohol aldehyde, or acid aldehyde: thus, glycol alcohol could yield

Glycol alcohol.	Glyoxal.	Glyoxylic acid?

Sea-weeds, with other allied species. Lindley elevates the Algæ into an alliance called Algales, which he divides into five orders. [ALGALES.]

āl'-gal, *a.* [Lat. *alga*=a sea-weed.] Pertaining to sea-weeds, or to the botanical order of Algæ.

āl-gā-lēs, *s. pl.* [Lat. *alga*=a sea-weed.] [ALGA.] An alliance of plants, belonging to the class Thallogens, and consisting of Sea-weeds and their allies. The species are flowerless, without proper leaves, but the higher species have lobed fronds formed of uniform cellular tissue, and the spores contained in thecae. The alliance contains five orders: Diatomaceæ, Confervaceæ, Fucaceæ (the typical one), Ceramiaceæ, and Characeæ (q. v.). Another division given of them is into Melanospermeæ, or olive-spored; Rhodospermeæ, or rose-spored; and Chlorospermeæ, or green-spored. In 1827 Lindley estimated the known species at 1,994. The most highly-organized and typical of the Algales inhabit the ocean, their geographical distribution in it being marked, like that of plants on land; others occur in fresh water, and some on damp soil, rocks, walls, or glass.

äl'-gë-brä, s. [In Sw., Dan., Dut., Ger., Sp., Port., and Ital. *algebra*; Fr. *algèbre*. Evidently all from Arabic. Many etymologies from this language have been given. It has been taken from the Arabic phrase, *al jebr e al mokabalah*=restoration and reduction (*Penny Cyclo.*). This view is essentially adopted by Wedgwood, who spells the phrase *el jabr wa el mogâbala*, and renders it=*the putting together of parts and equation.*] What Sir Isaac Newton termed *universal arithmetic*. The department of mathematics which enables one, by the aid of certain symbols, to generalize, and therefore to abbreviate, the methods of solving questions relating to numbers. It was not till a late period that the Greeks became acquainted with algebra, the celebrated treatise of Diophantus not having appeared till the fourth century, A. D. The science came into Western Europe through the Arabs, who probably derived it from the Hindus. It conducts its operations by means of alphabetical letters standing for symbols of numbers, and connecting signs (+, −, &c.) representative of arithmetical processes. Of the letters, those near the commencement of the alphabet—*a, b, c, d*, &c.—generally stand for known quantities; and those toward its end—*x, y*, and *z*—for unknown ones. One of the most important operations in algebra is the solution of what are called equations—a beautiful and interesting process which, without tentative guesses of any kind, fairly reasons out the number or numbers for which one or more unknown quantities stand.

"The Greek *Algebra* was as nothing in comparison with the Greek Geometry; the Hindn Geometry was as little worthy of comparison with the Hindu *Algebra.*"—*Calcutta Review*, ii. (1846), p. 540.

Double Algebra: A term introduced by Prof. De Morgan for a kind of algebra, which he thus defines:

"*Signification of Symbols in Double Algebra.* This particular mode of giving significance to symbolic algebra is named from its meanings requiring us to consider space of two dimensions (or area), whereas all that ordinary algebra requires can be represented in space of one dimension (or length). If the name be adopted, ordinary algebra must be called *single.*"

Äl'-göl, s. [Corrupted Arabic.] A fixed star in Medusa's head, in the constellation Perseus. It is called also (Beta) Persei. It is technically of 2½ magnitude; but really varies in brilliancy from the second to the fourth magnitude in 3½ hours, remaining thus for about 20 minutes. In 3½ hours more it is again of the second magnitude, at which it continues for 2 days 13 hours, after which the same series of changes takes place again.

Investigations have provided an explanation for these phenomena. Astronomers have recently discovered that Algol, which is a sunlike star, has a dark star revolving around it. It so happens that the plane in which this dark star moves comes close to the observer's eye, and hence, in the course of each revolution, the dark object comes between the eye and Algol and intercepts a portion of its light, thus causing the variations of magnitude.

All Fools' Day, s. The 1st of April; the day when, according to the ethics handed down, probably from pre-Christian times, it is considered right, if not even laudable, to make fools of all people, if one can, or at least of as many as possible. The approved method of doing this is to send them on silly or bootless errands. The victim thus entrapped is called in England an April fool, in Scotland an April gowk, and in France *Poisson d'Avril*, an April fish. A similar practice obtains in India at a somewhat licentious festival called the *Huli*, or *Holee*, which is designed to celebrate the vernal equinox. The habit of making the 1st of April a day of practical joking was once common in the United States, but is now falling into disuse.

"The first of April, some do say,
Is set apart for *All Fool's Day*."

1. A discourse designed to convey a different meaning from that which it directly expresses. A figure of speech or a literary composition in which a speaker or writer gives forth not the actual narrative, description, or whatever else he seeks to present, but one so much resembling it as on reflection, to suggest it, and bring it home to the mind with

greater force and effect than if it had been told directly. In many cases the description given appeals to the eye, while the truth designed to be conveyed is one of a moral or spiritual kind. As a quotation already made [ALLEGORIST] shows, Macaulay considered John Bunyan as unquestionably the first of allegorists; and every reader of the "Pilgrim's Progress" will at once understand both what an allegory is, and how effectual a vehicle it can be made for the communication of religious knowledge. Spenser's "Faerie Queene" is a moral allegory. A brief allegory may be considered as a *single metaphor*; a long one as a *series of metaphors*. The distinction between an *allegory* and a *parable* is very slight. Crabbe says that a *parable* is mostly employed for moral purposes, and an *allegory* in describing historical events. The latter differs from a riddle or enigma in not being intended to perplex. For the distinction between an *allegory* and a *myth*, see the subjoined example from Max Müller.

"The difference between a myth and an *allegory* has been simply but most happily explained by Professor Blackie in his article on Mythology in *Chambers' Cyclopaedia*. 'A myth is not to be confounded with an *allegory*; the one being an unconscious act of the popular mind at an early stage of society; the other, a conscious act of the individual mind at any stage of social progress.'"—Max Müller: *Science of Language* (6th ed., 1871, vol. ii., p. 430.

"And thus it was: I writing of the way
And race of saints, in this our gospel day,
Fell suddenly into an *allegory*

āl-lōx'-ān, *s.*

Chem.: A substance obtained by the action of strong nitric acid on uric acid in the cold. Alloxan crystallizes in large efflorescent rectangular prisms, $C_4N_2H_2O_4 \cdot 4H_2O$, which lose their water of crystallization at 160°. Alloxan dissolves in water; the solution is acid and astringent, and stains the skin red; it gives a blue color with a ferrous salt and an alkali, and white precipitate of oxaluramide with hydrocyanic acid and ammonia.

āl-lōx'-ān'-ic, *a.* [Eng. *alloxan*; -ic.] Pertaining to alloxan.

alloxanic acid, *s.*

Chem.: $C_4H_4N_2O_5$. A bibasic acid obtained by adding baryta-water to a solution of alloxan heated to 60°, and decomposing the barium salt by dilute sulphuric acid. Alloxanic acid crystallizes in small radiated needles. Its silver salt is insoluble and anhydrous, and when its salts are boiled with water they are decomposed into urea and mesoxalates.

āl-lōx'-ān'-tin, *s.*

Chem.: $C_3N_4H_4O_7 \cdot 3H_2O$. A substance obtained by passing H_2S through a strong cold solution of alloxan, when the alloxantin is precipitated along with sulphur; it dissolves in boiling water, and separates on cooling in the form of small four-sided, oblique, rhombic, colorless prisms. Its solution reddens litmus paper, gives a violet-colored precipitate with baryta-water, which disappears on heating; it reduces silver salts. By chlorine or nitric acid it is oxidized to alloxan. It is converted into dialuric acid by passing H_2S through a boiling solution of it. A hot saturated solution of alloxantin, mixed with a neutral salt of ammonia, turns purple, which disappears, uramide being deposited. When boiled with water and lead dioxide, alloxantin forms urea and lead carbonate. Its crystals, when heated to 150°, give off their water of crystallization.

al-lōy', ***al-lā'y**, ***al-lā'ye**, *s.* [In Dut. *alloy*; Fr. *aloi* (from *loi*=law), *alliage*; Sp. *liga*; Port. *liga*; Ital. *lega*, *leganza*=league, alloy. (See the verb.) Connected with Lat. *ligo*=to bind, and with *lex*=law; the proportion of any metals combined for the purpose of the coinage being regulated by law. (See *Wedgwood*, &c.)]

¶ Alloy was formerly spelled ALLAY (q. v.).

A. Ordinary Language:

I. Literally:

1. The act of mixing a baser with a more precious metal for a legitimate purpose or for fraud. Used specially, though not exclusively, of the coinage. The general alloy of gold is from twenty-two to two

per cent.; a pound of silver contains 11 oz. 2 dwt. of silver, and 18 dwt. of alloy. For jewelry there are the following legal standards: 18, 15, 12, and 9 carats.

"The gold of hem hath now so badde *aloyes*

With bras, that though the coyn be fair at ye,

It wolde rather brest in tuo than pleye."

Chaucer: C. T., 9,043-5.

2. The baser metal so mixed with the one more precious.

II. *Fig.*: The act of mixing anything of lesser value, or of no value at all, with something precious.

"It would be interesting to see how the pure gold of scientific truth found by the two philosophers was mingled by the two statesmen with just that quantity of *alloy* which was necessary for the working."—*Macaulay: Hist. Eng.*, ch. xxi.

B. Technically:

1. *Chem.*: The mixture of any metal with any other, precious or less precious, it matters not, mercury only being excepted. A mixture of mercury with another metal is called an amalgam, and not an alloy. [**AMALGAM**.]

"The combinations of metallic elements among themselves are distinguished by the general term *alloys*, and those of mercury as amalgams."—*Graham: Chem.*, 2d ed., vol. i., p. 115.

2. *Min.*: A *natural alloy* is the occurrence of two or more metals united in a state of nature. *Osmium* and *iridium*, when met with, are always in this condition. [**IRIDOSMINE**.] On the contrary, the alloys of metals for manufacturing purposes are, as a rule, artificially made. Thus brass, an alloy of copper, contains 28 to 34 per cent. of zinc; gun-metal, 90 parts of copper to 10 of tin; bronze, 91 parts of copper, 2 parts of tin, 6 parts of zinc, and 1 part of lead.

al-lōy', ***al-lā'y**, ***al-lā'ye**, *v. t.* [Apparently from the verb, rather than the verb from it. In Fr. *allier*=(1) to ally, to unite, to alloy; Port. *ligar*; Lat. *ligo*=to bind.] [**ALLAY**.]

I. Literally:

1. To mingle a precious metal with one of a baser character.

"Silver may be readily *alloyed* with most metals."—*Graham: Chem.*, 2d ed., vol. ii., p. 343.

2. To mingle two metals together without reference to the question whether one is more and the other less precious.

āl'-spīce, *s.* [Eng. *all*; *spice*. So named because its flavor somewhat resembles that of a mixture of cinnamon, cloves, and nutmeg.]

1. A kind of pepper, consisting of the dried berries of *Pimenta officinalis* (*Myrtus Pimenta*, Linn., *Eugenia Pimenta*, De C.), a tree belonging to the order Myrtaceæ (Myrtle-blossoms). It is imported almost entirely from Jamaica, and is hence called *Jamaica pepper*. It is termed also *Pimento*, from Sp. *pimiento*=pepper; its berries in shape and flavor resembling peppercorns. The trees are cultivated in Jamaica in plantations called pimento walks. Their unripe fruits, and to a lesser extent all parts of them, abound in an essential oil, which has the same composition as oil of cloves; of this the berries yield from three to five per cent. It is a powerful irritant, and is often used to allay toothache.

Allspice (*Pimenta Officinalis*).
(Leaves, Flower, and Fruit.)

The bruised berries are carminative; they stimulate the stomach, promote digestion, and relieve flatulency. The allspice imported into this country is derived from *Pimenta officinalis*, and not from *Pimenta acris*. The latter affords a product somewhat similar, which is occasionally used as a substitute for the other. Hence the *allspice-tree*, properly so called, is the *Pimenta officinalis*.

2. The English name of the genus *Calycanthus*, and specially of *C. floridus*, which has a scent like the pimento-tree, grows in Carolina, and is often called the *Carolina allspice*. Lindley, in his *Nat. Syst. of Bot.*, termed the order Calycanthaceæ, the Carolina Allspice tribe; but in his *Veg. Kingd.* he altered the designation to Calycanth.

¶ *Japan allspice* is the English name of the genus *Chimonanthus*, which belongs to the Calycanthaceæ; *Wild allspice* is *Benzoin odoriferum*, a species of the Laurel order.

āl-lū'-āud'-īte, *s.* [Named after M. Allaud.] The name given by Damour to a mineral supposed to be altered triplite, found near Limoges. It is not the same as the Allaudite of Bernhardt. Dana classes it as a variety of Triphylite (*q. v.*).

al-lūr'e, *v. t.* [From Fr. *leurrer*=to decoy, to lure; from *leurre*=a lure.] To draw or tempt one forward by presenting an object of attraction likely to act upon him or her, as bait does upon fishes, or the crumbs in a snare upon birds.

1. Containing an allusion. [See B.]

*2. Parabolical.

"*Allusive*, or parabolical, is a narration applied only to express some special purpose or conceit, which latter kind of parabolical wisdom was much more in use in the ancient times, as by the fables of Æsop, and the brief sentences of the Seven, and the use of hieroglyphics, may appear."—*Bacon: Advancement of Learning*, bk. ii.

B. *Technically*:

Her.: *Allusive arms*, called also *canting* or *punning arms*, and, by the French, *armes parlantes*, are those in which the charges suggest the bearer's name. Thus the arms of Castile and Leon are two castles and two lions. The arms of Arundel are swallows (*Hirondelles*). Alluvial deposits: Deposits consisting of alluvium (*q. v.*).

al-lū'-vī-ūm, **al-lū'-vī-ōn** (*Eng.*), **al-lū'-vī-ō** (*Scotch*), *s.* [In Fr. *alluvion*; Sp. *aluvion*; Port. *alluvia*; Ital. *alluvione*. From Lat. *alluvio*=(1) an inundation, (2) alluvial land; *alluo*=to wash against; *ad*=to, against; *luo*=to wash.]

A. *Ordinary Language*: The act or process of washing away soil, gravel, rocks, &c., and depositing the *débris* in other places; also the materials thus deposited.

"... either by *alluvion*, by the washing up of sand and earth, so as in time to make *terra firma*."—*Blackstone: Comment.*, bk. ii., ch. 17.

B. *Technically*:

I. *Geol. and Physical Geog.* In these sciences the form of the words is *alluvium*, or rarely *alluvion*.

*1. *Formerly*: The gravel, mud, sand, &c., deposited by water subsequently to the Noachian deluge. It was opposed to *diluvium*, supposed to be laid down by the deluge itself, or, in the opinion of others, by some great wave or series of waves originated by the sudden upheaval of large tracts of land or some other potent cause, different from the comparatively tranquil action of water which goes on day by day. [DILUVIUM.]

2. *Now*:

(a) "Earth or mud, gravels, stones, and other transported matter which have been washed away and thrown down by rivers, floods, or other causes upon land not permanently submerged beneath the waters of lakes or seas." As generally used, the word is specially employed to designate the transported matter laid down by fresh water during the Pleistocene and recent periods. Thus it indicates partly a process of mechanical operation, and partly a date or period. It should not be forgotten that the former has gone on through all bygone geological ages, and has not been confined to any one time. Many of the hardest and most compact rocks were once loosely-cohering *débris* laid down by water. The most typical example of alluvium may be seen in the deltas of the Nile, Ganges, Mississippi, and many other rivers. Some rivers have alluviums of different ages on the slopes down into their valleys. The more modern of these belong to the recent period, as do the organic or other remains which they contain, while the older (as those of the Somme, Thames, Ouse, &c.), which are of Pleistocene age, enclose more or less rudely chipped flint implements, with the remains of mammals either locally or everywhere extinct. [NEOLITHIC, PALÆOLITHIC, PLEISTOCENE, &c.] Though in many cases it is possible clearly to separate alluviums of different ages, yet the tendency of each new one is to tear up, re-distribute, and confound all its predecessors.

"Moreover, the last operations of water have a tendency to disturb and confound together all pre-existing *alluviums*."—*Lyell: Elem. of Geol.*, ch. vii.

"As a general rule, the fluvialite *alluvia* of different ages . . ."—*Ibid.*, ch. x.

(b) *Volcanic alluvium*: Sand, ashes, &c., which, after being emitted from a volcano, come under the action of water, and are by it re-deposited, as was the case with the materials which entered and filled the interior of houses at Pompeii.

(c) *Marine alluvium*: Alluvium produced by inundations of the sea, such as those which have from time to time overflowed the eastern coast of India.

II. *Law*. The form of the word generally used in English law is *alluvion*, and in Scotch law *alluvio*. In both of these the enactment is, that if an "eyott," or little island, arise in a river midway between the two banks, it belongs in common to the proprietors on the opposite banks; but if it arise nearer one side, then it belongs to the proprietor whose lands it there adjoins. If a sudden inundation cut off part of a proprietor's land, or transfer the materials to that of another, he shall be recompensed by obtaining what the river has deposited in another place; but if the process be a gradual one, there is no redress. (*Blackstone: Comment.*, bk. ii., ch. xvii.)

Wedgwood points out that in the Arab. of Syria *almanakh* is=climate or temperature. Others consider the word to be of Teutonic derivation. Thus Dean Hoare believes it Anglo-Saxon. He says that a square stick on which the Anglo-Saxons carved the course of the moon during the year, to fix the times of new and full moon and the festival days, was called by them *almonaght*=all-moon-heed. (*Hoare: Eng. Roots*, 1855.) Other derivations, both Arabic and Teutonic, have been given.]

*1. A kind of instrument, usually made of wood, inscribed with various figures and Runic characters, and representing the order of the feasts, the dominical letters, the days of the week, the golden number, and other matters. It was used by the old Scandinavian nations for the computation of time, civil and ecclesiastical. It might be made of leaves, connected like those of books, or of brass, or horn, or the skins of eels; or the information might be cut on daggers, or on tools of various kinds. Such productions were sometimes called rimstocks, or prinistaries, or runstocks, or runstuffs, or clogs. Remnants of them are still found in some English counties.

2. A small book primarily designed to furnish a calendar or table of the days belonging to the several months of the year for which it is constructed. It is known that an almanac was published by the Greeks of Alexandria about the second century A. D. Almanacs were produced by Solomon Jarchus, about 1150 A. D.; by Purbach 1450-1461; and by Regiomontanus between 1475 and 1506.

¶ *The English Nautical Almanac* is a work originated in the year 1767, by Dr. Maskelyne, the astronomer royal, and many years edited by him. It contains a summary of the lunar observations made at Greenwich Observatory, and by its aid the mariner observes the moon and adjacent stars with his sextant, and from comparison of his observations with the positions given in the Nautical Almanac computes his longitude, and ascertains the place of his vessel on the trackless ocean. This work contains about 600 pages of elaborate astronomical tables, constructed specially for the use of seamen in any part of the globe, but containing valuable information for the astronomer on land. Each month has twenty pages, containing full details of

the phenomena of the sun and moon; then follow the ephemerides of the seven principal planets. After this come a catalogue of the leading fixed stars, with their annual variations, followed by a list of the principal stars near which the moon passes in her monthly revolution through the heavens. The eclipses of the year are elaborately described. Then follow a list of stars to be occulted by the moon during each month. The eclipses of Jupiter's satellites, so useful in determining the longitude at sea, together with the configuration of the satellites on those occasions when the planet is visible, are successively detailed; besides other matters equally valuable to the mariner. This almanac has always been published three or four years in advance, in order that it may be sent to all parts of the world in time for the observation of the phenomena described in its pages. A similar work is published in this country. The American Almanac, first published at Boston in 1830, embraces a great mass of statistical knowledge, besides that usually given in almanacs.

From Gr. *amygdalē*, *amygdalon*, and *amygdalos*=the almond fruit and the almond-tree.]

Almond (*Amygdalus Communis*).
(Leaves, Flowers, and Fruit.)

A. Ordinary Language:

1. The fruit of the almond-tree. It is a slight ovate drupe, externally downy. There are two varieties of it, the one sweet and the other bitter. Sweet almonds are eaten. Taken in moderate amount they are nutritive and demulcent, but consumed in large quantities they are purgative. Bitter almonds contain prussic acid, and eaten in large quantities are poisonous. The distilled water containing their concentrated essence, if drunk, is almost instantly fatal. Brandy and ammonia may be given as an antidote.

"... spices and myrrh, nuts and almonds."—*Gen.* xliii. 11.

"Pound an *almond*, and the clear white color will be altered into a dirty one, and the sweet taste into an oily one."—*Locke*.

2. The tree on which the fruit now described grows, the *Amygdalus communis*, of which there are two varieties, the *A. communis*, simply so termed, and the *A. communis*, var. *amara*, or bitter almond. The former has pink and the latter white flowers. They bloom very early in the season. The leaves are oblong-lanceolate, with serrated margins. Both varieties are found in the south of Europe, the sweet one being the more common. They seem to have come originally from Persia, Asia Minor, Syria, and the north of Africa. [AMYGDALUS.]

¶ Almond in Scripture seems correctly translated. "Many varieties of the *almond* are cultivated, differing in the nature of their fruits."—*Treas. of Botany*.

Thus *alms* in English, when traced to its origin, is really the Greek word *eleēmosynē* corrupted; and the fact that so long a Greek word should have been worn away into so short an English one, is fitted to suggest that in these islands during the Middle Ages it can scarcely ever have been out of people's lips. The Continental nations, it will be observed, have not yet succeeded in reducing the six Greek syllables into less than three or two; we have cut it away into a monosyllable, not susceptible of much further reduction. There must have been among our ancestors much charity or much mendicancy, or much of both one and the other.]

A. Ordinary Language: Money, food, clothing, or anything else given as a gratuity to relieve the poor. [OBLATION.]

¶ The *s* of the word *alms* is not the sign of the plural; it is the *s* of the Greek word. *Alms* is now, however, often used as a plural.

"... whan a freeman by kyn or burthe is constrained by povert to eten the *almes* of his enemyes."—*Chaucer: Tale of Melibeus*.

āl'-œe, s. [In Sw. *aloërt*; Dan., Dut., Ger., Sp., and Ital. *aloe*; Port. *aloe*, *aloes*; Fr. *aloes*; Lat. *aloe*; Gr. *aloë*. Not the same as the *aghl* of some Hindoo languages.] [See AGALLOCH, AGILA.]

A. Ordinary Language:

1. Any species of the genus described under B, or even of one, such as Agave, with a close analogy to it.

† The American aloe is the *Agave Americana*, an Amaryllid.

2. The aloe of Scripture, which is probably the agallochum. Royle believes that the reason why the aloe proper and the agallochum became confounded was that *alloeh*, *alloet*, or *allieh*, the Arabic name of the latter, closely resembled *elwa*, the appellation given to the former in various Hindoo tongues. [See AGALLOCH.]

B. Technically:

Bot.: A genus of plants belonging to the order Liliaceæ, or Lily-worts, and constituting the typical genus of the section called Aloinae. The species are succulent herbs, shrubs, or even trees, with erect spikes or clusters of flowers. They are used in the West Indies for hedges; the juice is purgative, and the fibres are made into cordage or coarse cloth.

āl'-œes, *āl'-eiš, s. [ALOE.]

A. Ordinary Language:

I. Literally:

1. The drug described under B.
2. The aloe of Scripture. [Heb. *ahālim*, Prov. vii. 17; *ahāloth*, Ps. xlv. 8; Song iv. 14. Gr. *aloë*, John xix. 39.] The fragrant resin of the agalloch. [ALOE (A. 2), ALOES-WOOD, LIGN-ALOES.]

II. Fig.: Anything bitter to the feelings.

"And sweetens in the suffering pangs it bears,
The aloe of all forces, shocks, and fears."
Shakesp.: A Lover's Complaint.

B. Technically:

Pharm.: The inspissated juice of the aloe. The cut-leaves of the plant are put into a tub, the juice collected from them, and either boiled to a proper consistence or exposed to the sun till the fluid part evaporates. There are four principal kinds, two officinal. (1) Barbadoes Aloe (*Aloe Barbadoensis*), formed from the juice of the cut-leaf of *Aloe vulgaris*. It is imported in gourds, and has a dull yellowish-brown opaque color, breaks with a dull conchoidal fracture, shows crystals under the microscope, has a nauseous odor, and is soluble in proof spirit. (2) Socotrine Aloe (*Aloe Socotrina*), the produce of several species of aloe; it occurs in reddish-brown masses, and breaks with a vitreous fracture. Its powder is a bright orange color. It has a fruity smell. It comes from Bombay. (3) Hepatic Aloe, or East India Aloe non-official, is liver-colored; its powder is yellow. (4) Cape Aloe, the produce of *Aloe spicata* and other non-official species, is a greenish-brown color; this is given to horses. An inferior variety is called Caballine Aloe. Aloe acts as a purgative, affecting chiefly the lower part of the intestinal canal. It increases the flow of the bile; it often produces griping when given alone, and sometimes causes hæmorrhoids.

The watery extract of aloes is free from these objectionable properties. Cape Aloes is less purgative. The use of aloes is not followed by constipation. Aloes has a very bitter taste.

aloes-resin, s.

Chem.: A substance differing from resin in being soluble in boiling water. It is produced by the oxidation of aloine.

aloes-wood, s.

A. As adjective:

1. Not in the company of others; by one's self, in solitude. (Used of one single person when temporarily or permanently apart from all others.)

"I watch, and am as a sparrow alone upon the house-top."—*Ps.* cii. 7.

† Sometimes the word *all* is prefixed to *alone* to render the idea of solitude more emphatic.

"Alone, alone, all, all alone,
Alone on the wide, wild sea."

Coleridge: Ancient Mariner.

† It may be used of two or more persons separated from all other company.

"... and they two were alone in the field."—1 *Kings* xi. 29.

She is alone."—*Shakesp.: Two Gent.*, ii. 4.

To let alone signifies=to leave undisturbed, to allow to remain quiet. (Followed by an objective case of a person or thing.)

Chaucer: C. T., 12,053.

"With wise reluctance, you would I extol,
Not for gross good alone which ye produce."

Wordsworth: Excursion, bk. v.

† Blair objected to this adverbial use of the word. He thus discriminates between *only* and *alone*: "*Only* imports that there is no other of the same kind; *alone* imports being accompanied by no other. An only child is one which has neither brother nor sister; a child alone is one which is left by itself. There is a difference, therefore, in precise language betwixt these two phrases, 'Virtue only makes us happy,' and 'Virtue alone makes us happy.' Virtue only makes us happy, imports that nothing else can do it; virtue alone makes us happy, imports that virtue, by itself, or unaccompanied with other advantages, is sufficient to do it." (*Blair: Lectures on Rhetoric and Belles-Lettres*, 1817, vol. i., p. 230.)

The Twaite Shad spawns the Thames and other rivers in May, and spawns

there in July. The Alice Shad is rare in the Thames. The American species, *culpea sapidissima*, is abundant on the Atlantic coast, and ascends the larger rivers in the spring to spawn.

It is still retained in modern star-maps and catalogues.

Koppe in 1819, and Gesenius in 1837, with much probability, traced back most of the chief Syro-Arabian alphabets, and nearly all those current in Europe, to the ancient Phœnician one. The latter investigator constructed an elaborate table of their complex affinities. The square Hebrew now used in printing figures in this table as a descendant of the old Aramæan, modified by the influence of the Palmyrene letters. The old Greek characters are a primary offshoot from the earliest Phœnician, and the Roman letters are modifications of the Greek alphabet. Perhaps the old Phœnician alphabet itself may have been altered from the Egyptian hieroglyphics, and they again from picture writing like that by means of which the ancient Mexicans on the coast sent to their government an intimation that white men (Spaniards) had landed in their country. [*HIROGLYPHICS*.] Those families or groups of alphabets exist besides those now indicated. The cuneiform letters of Babylon, Assyria, Persia, &c., are not closely akin to these now described, and appear independent. [*ARROW-HEADED*, *CUNEIFORM*.] The alphabets of all the modern languages of India have apparently been derived from one common character—the Devanagari. Inscriptions in caves, on seals, &c., show an older form of this than that to which one is accustomed in ordinary Sanscrit books. It does not seem to have sprung from the Phœnician. [*DEVANAGARI*.] Similarly independent of the latter tongue and of each other are the Chinese characters, the Mexican or Aztec alphabet, and that of Yucatan. Other groups may yet be dis-

covered, and some of those already known may be affiliated together. It will be observed that any division of mankind formed on similarity or dissimilarity of their alphabets would be of an artificial kind: it is mainly on philology, physiology, and history that a proper ethnological arrangement must rest. From Lat. *altar* or *altare*=an altar, especially one higher and more splendidly adorned than an *ara*. From *altus*=high.]

A. Literally: An erection made for the offering of sacrifices for memorial purposes, or for some other object.

1. In Patriarchial times. An altar designed for sacrifice is mentioned in Scripture as early as the time of Noah (Gen. viii. 20). Abraham, Isaac and Jacob built several altars in places where for a brief or more lengthened period they sojourned. Most of these appear to have been for sacrificial purposes, and one or two seem to have been for memorial ends; but the most unequivocal case of the memorial altar was subsequently. (Josh. xxii. 10-34; Gen. xii. 7, 8; xiii. 4, 18; xxii. 9; xxvi. 25; xxxiii. 20; xxxv. 1, 7.)

2. In Jewish times: At Sinai directions were given that altars should be of earth or of stone unhewn, and that the ascent to them should not be by steps (Exod. xx. 24-26). When the tabernacle worship was established, there was an altar of wood covered with brass, designed for sacrifice, and one overlaid with gold, on which incense was burnt (Exod. xxvii. 1-8; xxxi. 1-10). Both had projections at the four corners of the upper surface. To those of the brazen altar victims were bound, and a fugitive from death seizing hold of one of these could not legally be dragged away to meet his doom. Strictly speaking, all sacrifices were to be confined to the one sacrificial altar, but the injunction was observed only to a partial extent. (1 Sam. vii. 17; 2 Sam. xxiv. 25; 1 Kings xviii. 32.)

3. In Christian times:

(a) In the early Christian centuries altars were generally of wood. During the sixth century stone was employed in the construction, and this continued to the time of the Reformation.

(b) In the Church of Rome an altar is essential, it being believed that in the mass an actual though bloodless sacrifice is offered for sin. Formerly, also, there was an upper altar (superaltare), which was a small portable one for the consecration of the communion elements, when the priest had not the opportunity of using the altar in a church or chapel.

(c) In the Church of England. The stone altars which were in the churches when the Reformation began [see (a)] were removed about the year 1550, and tables substituted for them. Queen Mary restored the altars, which were, however, again removed on the accession of Queen Elizabeth. What is sometimes called "the altar" is everywhere in the Prayer Book called "the holy table."

4. Among the old ethnic and modern non-Christian nations. Many of the old ethnic nations built altars for idolatrous worship on the tops of hills or in groves. The Greeks and Romans built high altars to the heavenly gods, and some of lower elevation to the demigods and heroes, whilst they worshiped the infernal gods in trenches scooped out of the ground. Many nations have had, and yet possess, altars of turf, stone, wood, or, in rare cases, even of horn; but they are wholly absent among the Mohammedans.

B. More or less figuratively:

1. Used of Christ, by the figure of speech called metonymy, by which the altar is substituted for the pious victim offered upon it in sacrifice. (Heb. xiii. 10.)

2. The most sacred spot or most sacred service of religion, truth, or ought else to which complete consecration of the powers is due. (Pope: Homer's Iliad, v. 592.)

3. The hymeneal altar, or simply the altar: The altar in a church before which a marriage is solemnized. [HYMENEAL.]

4. Used also as the synonym of religious liberty and privilege.

"Strike, till the last armed foe expires,
Strike, for your altars and your fires,
God and your native land."

Fitzgreene Halleck.

Math. *Alternate angles*: Two angles are said to be alternate with each other when they are made by two straight lines, intersected by a third, and are on opposite sides of that third. One alternate angle is beneath the first of the two lines so intersected, and the other is above the second one. If the two straight lines be parallel, then the alternate angles are equal to each other. (See Euclid, I. 29.) If the straight line A B intersect the two parallel straight lines C D and E F, then C G H and G H F constitute one, and D G H and G H E a second pair of alternate angles.

Her. *Alternate quarters*: A term applied to the first and fourth quarters on an escutcheon, which are generally of the same kind; and also to the second and third, which also similarly resemble each other.

B. As substantive: That which alternates with anything else; an alternative; a vicissitude.

"'Tis not in Fate th' alternate now to give."

Pope: *Homer's Iliad*, bk. xviii., 117.

"And rais'd in pleasure, or repos'd in ease,
Grateful alternates of substantial peace."

Prior.

C. As adverb: Alternately.

¶ Common in poetry, owing to the difficulty of introducing *alternately* into a line.

"And live alternate, and alternate die,
In hell beneath, on earth, in heaven above."

Pope: *Homer's Odyssey*, bk. xi., 372-3.

"Oft, placed the evening fire beside,
The minstrel art alternate tried."

Scott: *Rokeby*, iv. 13.

2. Geom. or Alg.: If there be four magnitudes or quantities in proportion, of which the first is to the second as the third to the fourth, then either of the expressions *permutando* (by permutation) or *alternando* (alternately) is employed, when it is inferred that the first proportional has the same ratio to the third that the second has to the fourth, or that the first is to the third as the second is to the fourth.

Alternately Pinnate Leaves.
(*Toluifera Balsamum*.)

Thus if AB : CD :: MN : PQ,

A. Ordinary Language:

I. Gen.: The succession of things to one another in a reciprocal order; interchange of things oftener than once with others, in time or in space.

(a) In time:

"... the alternation of day and night . . ."—Lewis: *Astron. of the Ancients*, ch. i., § 3.

"During two or three days there were many alternations of hope and fear."—Macaulay: *Hist. Eng.*, ch. xx.

(b) In space:

"Each successive tide brings its charge of mixed powder, deposits its duplex layer day after day, and finally masses of immense thickness are piled up, which, by preserving the alternations of sand and mica, tell the tale of their formation."—Tyndall: *Frag. of Science*, 3d ed., p. 408.

II. Specially:

1. Responses by the congregation in liturgical worship.

"For such alternations as are there used must be by several persons; but the minister and the people cannot so sever their interests as to sustain several persons, he being the only mouth of the whole body which he presents."—Milton: *Apology for Smectymnus*.

2. Alternate performances between the two divisions of a choir.

B. Technically:

1. Biol. or Zool. *Alternation of Generations*: The rendering of a scientific term used by Prof. Steenstrup to express an abnormal kind of generation, called by Prof. Owen *Metagenesis*. It implies that one kind of birth takes place in one generation, and another in the next; the third is again like the first, and the fourth resembles the second. In the first generation there is the ordinary propagation of the race by impregnation; in the second, immature animals, which appear as if they had not passed beyond the larval state, give birth to young. This feature in the case Prof. Owen calls *Partheno-genesis* (q. v.). By the curious arrangement now mentioned, the young do not resemble their immediate parents, but their grandparents; as in due time what may be termed their grandchildren will resemble them. The best known instance of alternation of generations is in the Aphides. [APHIS.] (Steenstrup: *Alternation of Generations*, Ray Society. Owen: *Invert. Anim.*, 2d ed., pp. 667, 668.)

2. Alg.: Alternations are the same as what are more generally called permutations.

B. As substantive:

1. Strictly: Permission to choose either of two things, but not both; also the two things viewed as standing together that choice may be made between them. In this sense it has no plural.

3. Still more loosely: One of several things offered to choose among.

1. *Chem.*: The name given to double salts of sulphate of aluminium with sulphates of potassium, sodium, ammonium, or of other monatomic metals, as silver, thallium, cesium, rubidium. They crystallize in octohedra. Potash alum, $Al_2K_2(SO_4)_4 + 24H_2O$, is prepared by the decomposition of a shale containing iron pyrites, FeS_2 , which is gently burnt and exposed to the air in a moist state; it oxidizes and forms sulphates, and, on the addition of a potash salt to the solution obtained by water, alum crystallizes out. Alum has a sweet astringent taste, reddens litmus paper, and dissolves in its own weight of boiling water. Sodium alum is very soluble. Ammonium alum is often prepared by adding the ammonia liquor of gas-works instead of potash. Alum is used in dyeing and in preparing skins, &c. Alums can be also formed in which ferric or chromic sulphates replace aluminium sulphate, as potassio-ferric sulphate, $Fe_2K_2(SO_4)_4 + 24H_2O$, and ammonio-chromic sulphate, $Cr_2(NH_4)_2(SO_4)_4 + 24H_2O$. These crystallize in the same form, and cannot be separated from each other by crystallization. Alum is used in medicine as an astringent in doses of ten to twenty grains. Burnt alum is alum deprived of its water of crystallization by heat; it is used externally as a slight escharotic.

"... and oyle

***alum-earth**, or **poleura**, *s.* Names formerly given to a fibrous mineral of a silky luster, brought by Dr. Gillies from the Chilian Andes. It was said to be used by the inhabitants as a mordant in dyeing red. Ure describes alum-earth as an impure earthy variety of lignite. Both *alum-earth* and *poleura* seem to have disappeared from the most modern works on mineralogy.

alum-root, s.

āl'-ū-mīn-a, **āl'-ū-mīne**, *s.* [In Fr. *alumine*; from Lat. *alumina*, pl. of *alumen*=alum.]

1. **Chem.:** The only oxide of aluminium known. Its sp. gr. is 3.9. It is isomorphic with ferric and chromic oxides. It occurs native in crystals, as corundum, ruby, sapphire, and less pure as emery. It is the hardest substance known except the diamond. It can be obtained by precipitating a salt of aluminium by ammonia and igniting the precipitate. It is nearly insoluble in most acids. It is a white, insoluble, tasteless, amorphous powder. Three hydrates are known, $Al_2O_3 \cdot H_2O$, $Al_2O_3 \cdot 2H_2O$, and $Al_2O_3 \cdot 3H_2O$; the trihydrate is the ordinary gelatinous precipitate. It is soluble in acids and fixed alkalis. It is a weak base, many of its salts having an acid reaction. It is largely used in dyeing as a mordant. It forms insoluble compounds with vegetable colors called *lakes*. It occurs native as *Gibbsite*. The monohydrate is *Diaspore*. The dihydrate cannot act as a mordant; it is soluble in acetic acid. (See *Watts' Dict. Chem.*) Silicate of aluminium forms the basis of clays.

2. **Mineralogy.** Aluminium, sometimes called argil, or the argillaceous earth, is the basis of all clays, and imparts to them the plastic character for which they are distinguished. For the aspects which it presents when it occurs native, see No. 1. It enters into the composition of many minerals, the proportion in which it occurs being generally stated just after that of the silica; thus, garnet taken from the Ural mountains has silica 36.86, and alumina 24.19.

Found in the Harz mountains, in Germany, and in Sussex, in England, &c.

āl'-ūm-in-i-ūm, **āl'-ūm-in-ūm**, *s.* [In Ger. & Dut. *aluminium*. From Lat. *alumen*=alum.]

Chem.: A tetratomic metal; symbol Al; atomic weight 27.4; sp. gr. 2.6; melts at red heat. It is a

white, sonorous, ductile, malleable metal, not oxidized in the air, nearly insoluble in dilute sulphuric or nitric acid, readily soluble in HCl, and in solutions of potash or soda with evolution of H. It is used for instruments and ornaments; it forms a valuable alloy with copper, resembling gold, and not easily tarnished, called aluminium bronze. It is prepared by decomposing the double chloride of aluminium and sodium by metallic sodium. It forms one oxide, alumina, Al_2O_3 (q. v.). Its most important salts are alums (q. v.) and aluminium chloride, Al_2Cl_6 , which is formed when aluminium hydrate is dissolved in HCl, but upon evaporation HCl escapes and leaves Al_2O_3 . It can be obtained by pouring Cl over a mixture of Al_2O_3 and carbon heated to redness. It is a transparent waxy substance, boiling at 180° . It forms double salts with alkaline chlorides, as $Al_2Cl_6 \cdot 2NaCl$. Aluminium fluoride Al_2F_6 , also forms double salts, aluminium and sodium. Fluoride, $Al_2F_6 \cdot 6NaF$, occurs as the mineral cryolite in Greenland. Numerous silicates of aluminium occur as minerals [see CLAYS, FELDSPAR, &c.]. The salts of aluminium are recognized by giving a blue color when moistened with nitrate of cobalt, and heated before the blow-pipe. Alumina is precipitated from its solutions by caustic alkalis as a white precipitate, soluble in excess; ammonia gives a similar precipitate, insoluble in excess; alkaline carbonates precipitate the hydrate, and CO_2 escapes; ammonia sulphide gives a white precipitate of aluminium hydrate. The salts of aluminium belong to the same class as the ferric and chromic salts; oxides of aluminium, chromium, and sesquioxide of iron are precipitated with ammonia. [ANALYSIS.] The alumina and phosphate of aluminium are dissolved by boiling with caustic potash; phosphate of aluminium is distinguished by being insoluble in acetic acid.

[ALUMINILITE.] A mineral classed by Dana under his "Oxygen Compounds—Hydrous Silicates." It consists of about 35.50 of sulphuric acid, 39.65 of alumina, about 10 of potash, and 15 of water. It crystallizes in obtuse rhomboids, variously modified. It is white, grayish, or reddish. It varies from transparent to sub-translucent. Dana makes five varieties: (a) Crystallized; (b) Fibrous concretionary; (c) Massive and moderately tender; (d) Hard, mainly from disseminated silica; (e) Cavernous. It forms seams in trachytic and allied rocks, being produced by the action on them of sulphurous vapors. It occurs in Italy, Hungary, and France. Roman alum is prepared from this mineral. It is almost free from iron.

"*Alum-stone* appears to be continually produced at the Solfatara, near Naples, and other volcanic districts, by the joint action of sulphurous acid and oxygen upon trachyte; a volcanic rock composed almost entirely of feldspar."—*Graham's Chem.*, vol. i., p. 607.

It is white, tinged with yellow or red, has a vitreous luster, is sub-translucent or transparent, and tastes like alum. It is a sulphate of alumina, containing about 36.40 of sulphuric acid, 16 of alumina, and 46 of water. It is found near Bogota, and also in the vicinity of Königsberg.

It was she who, according to the old Roman legend, offered Tarquinius Priscus the nine Sibylline books at a price so high that, instead of giving her what she asked, he laughed at her, believing her to be mad. On this she burnt three of the nine volumes in his presence, and asked the original price for the remaining six. Meeting with a second refusal, she proceeded to burn three more, and asked the full price for the remaining three. Awed by her extraordinary conduct, the king at last purchased the three for the sum originally asked for the nine. [SIBYL.]

From *Amanos*, a mountain in Cilicia, where many fungi grew.] A sub-genus of *Agaricus*, the typical genus of the alliance *Fungales*, and the order *Agaricaceæ*. The *A. muscaria* is ordinarily poisonous, so much so that the name *muscaria* (from *musca*=a fly) is designed to imply that the *Amanita* steeped in milk kills the flies which partake of the liquid thus poisoned. Yet, so much does the quality of a fungus depend on climate and place of growth, that, if Langsdorf is accurate, the *A. muscaria* in Kamschatka and other portions of Northeastern Asia, is not poisonous, but only intoxicating.

[AMARANTHUS.] *Amaranthus*. A natural order of plants, consisting of "Chenopodal exogens, with separate sepals opposite the stamens, usually one-celled anthers, a single ovary often containing several seeds, and scarious flowers buried in imbricated bracts." The order is divided into three sub-orders—*Gomphrenæ*, *Achyranthæ* and *Celoseæ*. The species are generally unattractive weeds, but sometimes they are of more showy appearance. In 1846 Lindley estimated the known species at 282; now, it is believed, about 500 are known. They occur chiefly in the tropics of America and Asia; a number also are Australian. None are truly wild in Britain; but the Cockscomb, the Globe Amaranth, the Prince's Feather, and Love-lies-bleeding, are found in gardens. Many *Amaranthaceæ* are used as pot-herbs. *Amaranthus obtusifolius* is said to be diuretic; *Gomphrena officinalis* and *macrocephala* have a high reputation in Brazil as remedies in intermittent fever, diarrhœa, colic, and snake-bite.

1. *Poet.*: An imaginary flower supposed never to fade.

Began to bloom: but soon for man's offense
To heaven removed, where first it grew, there grows,

And where the river of bliss through midst of heaven
Rolls o'er Elysian flowers her amber stream."

The leaves of *A. viridis* are employed externally as an emollient poultice. *A. obtusifolius* is said to be diuretic. *A. debilis* is used in Madagascar as a cure for syphilis. In their six-partite or six-cleft colored perianth, and their three-celled fruit, they resemble Lily-worts, from which, however, they are at once distinguished by their inferior ovary. In 1846 Lindley estimated the known species at four hundred. The representatives of the order in the English flora are *Narcissus*, *Galanthus*, and *Leucojum*. Beautiful as they are, most of them have poisonous bulbs. The Hottentots are said to dip the heads of their arrows in the viscid juice of the bulbs of *Hæmanthus toxicarius* and some allied species. Several are emetic, having a principle in their composition like that of the squill. *Oporanthus luteus* is purgative, *Alströméria salsilla* diaphoretic and diuretic, and *Amaryllis ornata* astringent. A kind of arrowroot is prepared in Chili from *Alströméria pallida* and other species. A wine called pulque is made from the wild Agave of Mexico.

I. *Gen.*: A messenger, by whomsoever sent.

"A wicked messenger falleth into mischief, but a faithful ambassador is health." —Prov. xiii. 17.

II. *Specially*:

1. *Lit.*: A minister of high rank sent on an embassy to represent nominally his sovereign, but really his country, at the court of another monarch, or at the capital of a republic. Sir Henry Wotton's definition of an ambassador as "an honest man sent to lie abroad for the commonwealth, however correctly it may have described the older school of diplomatists, is now, it is fondly trusted, quite out of date. (Wotton: *Letter to Velserus*, A. D. 1612.) Ambassadors are of two kinds: *extraordinary*, employed on special missions; and *ordinary*, who reside permanently at the seat of government to which they are accredited. All the ancient ambassadors were of the former class. In every civilized nation the person of an ambassador is sacred, his mansion also is inviolate, and his retinue subject to no local jurisdiction but his own. An *envoy* is an inferior kind of ambassador dispatched on a special mission. A *resident*, or *chargé d'affaires*, is also of less dignity than a proper ambassador. *Consuls* are again of inferior rank to residents, and are specially charged to protect and promote the commercial enterprise of their country in the place where they are stationed.

"Howbeit in the business of the ambassadors of the princes of Babylon who sent unto him to inquire of the wonder that was done in the land . . ." —2 Chron. xxxii. 31.

"... the killing of an ambassador." —Blackstone: *Comment.*, bk. iv., ch. 6.

"An extraordinary ambassador of high rank was instantly dispatched by Lewis to Rome." —Macaulay: *Hist. Eng.*, ch. xiv.

2. *Fig.*: An apostle, regarded as a representative of Christ, sent on a special mission to men.

"Now then we are ambassadors for Christ, as though God did beseech you by us: we pray you in Christ's stead, be ye reconciled to God." —2 Cor. v. 20.

ăm-bās'-sa-dōr, *v. t.* [From the substantive.] To oppress a sovereign with the incubus of too many and too importunate ambassadors.

¶ The use of the word as a verb is of recent invention, and can hardly be called correct.

"These are no longer the times in which a young, gentle, and nervous Sultan Medjid used to be 'literally ambassadored to death.'" —Times, Jan. 19, 1876, *Pera Corresp.*

ăm-bās'-sa-dōr'-i-al, *a.* [Eng. *ambassador*; -ial.] Pertaining to an ambassador; as "ambassadorial privileges."

In Sp. *ambar*; Port. *ambar*, *alambra*; Ital. *ambra* (all these forms meaning the mineral amber only); Pers. *ambar*, *anabar*; Arab. *anbar*, *anbarun* = (1) ambergris, (2) amber.] [AMBERGRIS.]

A. *As substantive*:

I. The genuine amber.

1. *As a mineral*. It is called also Succinite, from Lat. *succinum* = amber. [SUCCINITE.] Its color is generally yellow, but sometimes reddish, brownish, or whitish and clouded. It is resinous in lustre, always translucent, and sometimes transparent. It is brittle, and yields easily to the knife. It fuses at 287° C. It is combustible, burning readily with a yellow flame, and emitting an agreeable odor. It is also highly electrical, so much so that *electricity* is derived from the Greek word *elektron*, or *ēlektros* = amber. Composition: Carbon, 78.94; hydrogen, 10.53; oxygen, 10.53 = 100. Found occasionally in masses as large as a man's head; but at other times in smaller pieces, some no larger than a grain of coarse sand. It is found in Europe, Asia and America. It is valued as a gem.

"... whose sisters, metamorphosed into poplar-trees, shed tears at his death, which were hardened into amber." —Lewis: *Astron. of the Ancients*, ch. i., § 2.

"Pomeranian amber was set in Lydian gold to adorn the necks of queens." —Macaulay: *Hist. Eng.*, ch. xxiv.

2. *As a geological product*. Pliny was correct when he considered it to be an exudation from trees of the Pine family, like gum from the cherry, and resin from the ordinary pine. Prof. Göppert, of Breslau, in 1845, deemed it a resinous exudation from an extinct pine, *Pinus succinifer*, most nearly allied to *P. abies* (*Abies excelsa*, the Norway Spruce), or *P. picea* (*Abies picea*, the Silver Fir). He believed that forests of this tree once grew in

the southeastern part of what is now the bed of the Baltic, in about 55° north latitude and 37-38° east longitude; but that during the time of the drift they were swept away, and the amber carried south and southwest to Pomerania and the adjacent regions, where now it is found. Subsequently he discovered that amber had been formed not by the *P. succinifer* only, but by eight other allied species, if, indeed, all the Abietinæ and Cupressinæ of the time and place did not share in its production. In 1845 he thought it of the age of the *Molasse* (Miocene?); in 1854 he deemed it Pliocene, and perhaps of the drift formation (Upper Pleiocene = pleistocene); but its exact age is as yet undetermined. Of 163 species of plants found in it, thirty still exist. Eight hundred species of insects have also been met with in it, with remains of animals of other classes. (*Quart. Journ. Geol. Soc.*, vol. ii. (1846), i. 102; vol. x. (1854), ii. 1.)

II. The amber of Scripture.

¶ In Scripture the word "amber," Heb. *chashmal* (Ezek. i. 4, 27; viii. 2), is not what is now called by the name, but a mixed metal. It may be polished brass, or brass and gold, or silver and gold; it is difficult to say which.

"And I saw as the color of *amber*, as the appearance of fire round about within it . . ." —Ezek. i. 27.

B. *As adjective*:

An ambiguous expression is one which has apparently two senses, and leaves us at a loss which of them to give it. An equivocal expression is used with an intention to deceive; an ambiguous one, when it is used with design, is with an intention not to give full information. An honest man will never employ an equivocal expression; a confused man may often utter ambiguous ones without any design."

A-mēr'-ī-ca, *s.* The second in size of the five great divisions of the globe, extending from latitude 71° 24' N. to the Straits of Magellan, latitude 53° 53' 7" S. and covering an area of about 15,000,000 square miles; its native and immigrant populations include every race, and a majority of the nations and tribes of earth. America is often called the New World, from its recent discovery by Europeans. It is about equally divided into two sections, North and South America, joined by the narrow Isthmus of Darien and Central America. North America properly begins at the upper side of the Gulf of Mexico, or 30° N. latitude, and extends to the Arctic ocean, its greatest length being 4,000 miles, and its greatest breadth from the Atlantic to the Pacific, 3,500 miles; the eastern coast is indented with numerous bays, gulfs and inlets, and terminates in the long peninsula of Florida; the western coast has comparatively few good roadsteads, but is broken by the peninsula of Southern California, and the Aleutian islands. There are two main mountain ranges, one parallel to the east coast, but a considerable distance inland, called the Appalachian; the other along the western coast, known as the Sierra Nevada, the latter being much the higher. These grand ranges are each divided into three distinct chains, those on the east being the Alleghanies, the Green and White mountains; and in the west the Sierras, a loftier inner chain, of which Mt. St. Elias, 17,900 feet above sea level, is the chief peak, and the great Rocky mountain system. Between these mountain ranges lie the immense prairies, the valleys of the Mississippi, Ohio and Tennessee; to the north are the five great connected lakes, Superior, Michigan, Huron, Erie and Ontario, covering more than 120,000 square miles, and

making an open waterway from the Atlantic nearly half way across to the Pacific; still north of these are the great plains stretching to the Arctic ocean, and surrounding the vast inland sea known as Hudson's bay. The chief rivers are the Connecticut, Hudson, James, Ohio, Tennessee, Missouri, Mississippi, Red, Rio Grande, Columbia, Colorado, St. Lawrence, Mackenzie, Fraser and Yukon. Central America may be said to include the tableland of Mexico and extend south to Guatemala, the volcanic mountains of which are connected through the isthmus range with the Sierras of North America; the Rio Del Norte is the most important river. South America is 4,700 miles in extreme length, and about 3,200 in width; the Andes mountains extend along the western coast, the less lofty ranges of Venezuela in the north, those of Brazil in the northeast; its surface consists of vast plains, at various elevations, the principal divisions of which are known as the Pampas, the Silvas and the Llanos; the largest rivers are the Amazon, the Orinoco and the Rio de la Plata; the inhabitants consist of the native tribes in the interior and southern portions, Spaniards, Portuguese and mixed races along the seacoast and throughout the north. The divisions, sub-divisions and populations of the Continent are as follows: North America—Mexico, United States, Dominion of Canada, Newfoundland, Prince Edwards Island, British Columbia, Greenland, Bermuda, St. Pierre and Miquelon. Central America—Costa Rica, Nicaragua, Honduras, San Salvador, Guatemala and British Honduras; Spanish and British West Indies, Dutch, French and Danish possessions, Hayti and San Domingo. South America—Patagonia and Terra del Fuego, Uruguay, Paraguay, Gran Chaco and Pampas Argentino, Argentine Republic, Chili, Bolivia, Peru, Galapagos (uninhabited), Ecuador, New Granada, Venezuela, British, Dutch and French Guiana, Brazil and Falkland islands. The discovery of America by Christopher Columbus in 1492-98 opened it to European exploration and settlement, although Greenland was unquestionably visited by Scandinavian rovers in the sixth century, and it is believed Iceland voyagers reached the coast of New England in the tenth century. The most noted American explorers besides Columbus were Hendrick Hudson, Cortez, De Soto, Pizarro, Cabot and Magellan.

A-mēr'-i-can, *a. & s.* [Eng. *America*; -an. In Ger. *Amerikanisch*, adj., *Amerikaner*, *s.*; Fr. *Americain*, adj. *s.*; Sp., Port. & Ital. *Americano*. From *America*, the name applied to two great continents of the globe, called—with little regard to justice—after a Florentine, Amerigo Vespucci; though the great pioneer who had opened the way for him and other explorers had been the immortal Christopher Columbus. Columbus is popularly called the discoverer of America; but it appears established on good evidence, that about four centuries before he, on the memorable 12th of October, 1492, landed on Guanahani, or "San Salvador," one of the Bahama islands, the Norwegians had fallen in with Greenland, and had settled in it; nay, more, that they had even a feeble colony near Rhode Island, on the western continent itself. But no important results followed to mankind, or even to themselves, from these explorations. Alexander von Humboldt considers that the general adoption of the word *America* arose from its having been introduced into a popular work on geography published in 1507.]

A. As adjective: Pertaining to America.

"And that chill Nova Scotia's unpromising strand
Is the last I shall tread of American land."
Moore: *To the Boston Frigate*.

¶ A number of American animals and plants, though identical in genus, are yet different in species from their analogues in the Old World. A yet greater number are named as if they were of the same genus, though not so in reality. All such terms, and others similar to them, if they find a place in the Dictionary, will be arranged under one or both of the substantives with which the adjective *American* agrees. Thus, in Zoology, *American blight* (*Lachnus lanigerus*) will be found under BLIGHT; and in Botany, American Aloe (*Agave Americana*), under ALOE and AGAVE; American Cranberry (*Oxycoccus macrocarpus*), under CRANBERRY and OXYCOCCUS; and American Marmalade (*Achras mammosa*), under MARMALADE and ACHRAS.

B. As substantive:

I. Ordinary Language:

1. At first: An aboriginal of the New World; a so-called "Indian" belonging to the New World.

"Such of late

Columbus found the American, so girt
With feather'd cincture; naked else, and wild
Among the trees, on isles and woody shores."

Milton: *P. L.*, bk. ix.

2. Now: Any human inhabitant of America, aboriginal or non-aboriginal, white, red, or black. Specially, a native of the United States of North

America. The name began while yet the future Republicans were British colonists.

swarthy-brown, copper, or cinnamon-colored skin; a heavy brow; dull and sleepy eyes, with the corners directed upward—in this respect resembling those of the Malay and Mongolian races; prominent cheek-bones; a salient but dilated nose; full and compressed lips, and an expression of gentleness combined with a gloomy and severe look. It includes all the American Indians, with the exception of the Esquimaux (Eskimo), who appear to be Turanians from the north of Asia.

2. Philol.: All the American languages are classified as *polysynthetic*, by which is meant that the greatest number of ideas is compressed into the smallest number of words. [POLYSYNTHETIC.]

A-mēr'-i-can-ism, *s.* [Eng. *American*; -ism.]

A word or phrase believed to be of American origin, or, at least, to be now used nowhere except in America. The genuine Americanisms are far fewer than some suppose. A. As substantive:

1. A mineral, a variety of Quartz, named by Dana Amethystine Quartz. Its color, which is either diffused through the entire crystals or affects only their summits, is clear purple or bluish violet; hence it is sometimes called violet-quartz. The coloring matter is generally believed to be manganese, but Heintz considers it to arise from a mixture of iron and soda. The beauty and hardness of the amethyst cause it to be regarded as a precious stone. It occurs in veins or geodes in trappean and other rocks. The best specimens are brought from India, Armenia, and Arabia.

2. The Oriental amethyst: A rare purple variety of Sapphire (q. v.). [See also CORUNDUM.]

¶ The word *amethyst* in the English Bible [Sept. and N. T. Gr. *amethystos* (Exod. xxviii. 19; Rev. xxi. 20)] is the rendering of the Heb. word *achhelamah*. It is from the root *chhalam*=to sleep; apparently from the delusion that the fortunate possessor of an amethyst is likely to sleep soundly. The last stone in the third row of the Jewish high-priest's breastplate was an "amethyst" (Exod. xxviii. 19); and the twelfth foundation of the new Jerusalem, mentioned in Rev. xxi. 20, was to be an "amethyst."

3. A color, that of the mineral described above. (See B.)

"A hundred and a hundred savage peaks, in the last light of day; all glowing, of gold and amethyst . . ."—Carlyle: *Sartor Resartus*, bk. ii., chap. vi.

B. As adjective:

Her.: The term applied, in describing the armorial bearings of peers, to the color called purple.

"The twelfth the gentyleste in vch a plyt,
The amatyst purple with ynde blente."

Alliterative Poems; *Pearl* (ed. Morris), 1,014-15.

ām-hēr-st'-i-a, *s.* [Called after Lady Amherst, wife of Lord Amherst, Governor-general of India from 1823 to 1828.] A genus of plants belonging to the order Fabaceæ, and the sub-order Cæsalpinieæ. The only known species is the *A. nobilis*, one of the most splendid trees existing. The flowers are large, scentless, and of a bright vermilion color, diversified with three yellow spots, and disposed in gigantic ovate pendulous branches. The leaves are equally pinnate, large, and, when young, of a pale purple color. It grows near Martaban, in the Eastern peninsula. The Burmese call it *thoca*, and offer handfuls of the flowers before the images of Buddha.

ā-mī-a, *s.* [Lat. *amia*; Gr. *amia*=a fish, the *Scomber sarda* of Bloch, which is allied to the tunny.] A genus of fishes formerly placed in the Esocidæ, or Pike family, but now constituting the type of the Ganoid family Amiidæ (q. v.). The species inhabit rivers in the warmer parts of America. The *amia* of the ancients, it will be perceived, is quite different from any of these fishes.

Americans call this plant Fall Poison, and say that cattle are poisoned if they feed in the fall upon its foliage. The illustration shows the complete plant and one of the single flowerets.

So called because, it being incombustible, the ancients were wont from time to time to throw into the fire napery and towels made of it to cleanse them from impurity. They also sometimes enclosed the bodies of their deceased friends in cloth of the same material, that when cremation took place the ashes might remain free from intermixture with those of other people.]

1. *Min.*: A mineral, a variety of Asbestos, which again is classed by Dana as a variety of Amphibole. Tremolite, Actinolite, and other varieties of Amphibole, unless they contain much alumina, have a tendency to pass into varieties with long flexible fibers of flaxen aspect, to which the name of *amianthus* is applied.

2. A name for the fibrous kinds of chrysolite, which Dana classes as a variety of Serpentine. As in the former case, there are long flexible fibers, looking like those of flax. The color is greenish-white, green, olive-green, yellow, and brownish. It constitutes seams in serpentine rocks, occurring in Cornwall; Portsoy; Unst, and Fetlar, in Shetland; in Savoy, Corsica, the Pyrenees, and other localities. Most of the so-called amianthus is of this second variety.

"Halifax saw that an *amicable* arrangement was no longer possible."—*Macaulay: Hist. Eng.*, ch. x.

¶ Treating on the difference between *amicable* and *friendly*, Crabb says that *amicable* implies a negative sentiment, a freedom from discordance; *friendly*, a positive feeling of regard, the absence of indifference. We make an *amicable* accommodation, and a *friendly* visit. *Amicable* is always said of persons who have been in connection with each other; *friendly* may be applied to those who are perfect strangers. Neighbors must always endeavor to live *amicably* with each other. Travelers should always endeavor to keep up a *friendly* intercourse with the inhabitants wherever they come. "To live *amicably* or in *amity* with all men, is a point of Christian duty; but we cannot live in *friendship* with all men, since *friendship* must be confined to a few."

Chem.: Compounds in which one atom of hydrogen has been replaced by the monatomic radical (NH₂)'; as amido-propionic acid = C₂H₄(NH₂)₂, CO.OH.

amido-caproic acid, *s.*

Chemistry: C₅H₁₀(NH₂)CO.OH = Leucine. Produced by digesting together valeral ammonia, hydrocyanic acid and hydrochloric acid. It is also formed by the putrefaction of cheese, and by the treatment of horn, glue, wool, &c., with acids or alkalies. Leucine crystallizes in white shining scales, which melt at 100°. It is slightly soluble in water. When it is heated with caustic baryta, it yields amylamine and CO₂.

ām'-i-īd-æ, *s. pl.* [From *amia* (q. v.).] A family of fishes belonging to the order Ganoidea, and the sub-order Holostea. They have small horny scales, usually covered with a layer of animal matter. The tail is homocercal, but with a certain approach to the heterocercal type. The family consists of small fishes, inhabiting rivers in the warmer parts of America.

***ām'-il**. [AMEL, v.]

ām'-ineš, *s. pl.* [Eng. *am=ammonia*, or *ammonium*; suffix *-ine*.]

Chem.: Compound ammonias, having the hydrogen replaced, atom for atom, by alcohol radicals. When one atom of H is replaced, they are called monamines; when two H atoms, diamines; when three atoms of H, triamines. They are obtained by heating the iodides of the alcohol radicals with ammonia. Thus iodide of ethyl and ammonia yields ethylamine, N(C₂H₅)H₂; by heating the *mrno* and the diamines with more iodide of ethyl, diethylamine, N(C₂H₅)₂H, and triethylamine, N(C₂H₅)₃, are obtained. Triethylamine unites directly with iodide of ethyl, forming N(C₂H₅)₃.C₂H₅I, triethylamine ethyl iodide. This compound, heated with silver oxide and water, forms N(C₂H₅)₃.C₂H₅.OH, a strong base, which is solid, like caustic potash. The H atoms can be replaced by different alcohol radicals, as methyl-ethyl-amylamine, N(CH₃')(C₂H₅')(C₅H₁₁)'. The H can be also replaced by metals, as monopotassamine, NH₂K, and tripotassamine, NK₃. The amines have a strong alkaline reaction like ammonia, and unite with acids to form salts.

Chem.: A substance consisting of NH_3 . Molecular weight, 17. Sp. gr. 8.5, compared with H; compared with air (1), its sp. gr. is 0.59. It is a colorless, pungent gas, with a strong alkaline reaction. It can be liquefied at the pressure of seven atmospheres at 15°. Water at 0° dissolves 1,150 times its volume of NH_3 , at ordinary temperatures about 700 times its volume. A fluid drachm of *ammoniac liquor fortior* contains 15.83 grains of NH_3 , and has a sp. gr. of 0.891. The *liquor ammoniac* of the Pharmacopœia has a sp. gr. of 0.959, and a fluid drachm contains 5.2 grains of NH_3 . (Water being unity, the specific gravity of ammonia is .0007594.) Ammonia is obtained by the dry distillation of animal or vegetable matter containing nitrogen; horns, hoofs, &c., produce large quantities, hence its name of *spirits of hartshorn*. Guano consists chiefly of urate of ammonia. But ammonia is now obtained from the liquor of gas-works; coal containing about two per cent. of nitrogen. Ammonia is formed by the action of nascent hydrogen on dilute nitric acid. Ammonia gas is prepared in the laboratory by heating together one part of NH_4Cl with two parts by weight of quicklime, and is collected over mercury. NH_3 is decomposed into N and H_2 by passing it through a red-hot tube, or by sending electric sparks through it; the resulting gases occupy twice the volume of the ammonia gas. It is used in medicine as an antacid and stimulant; it also increases the secretions. Externally it is employed as a rubefacient and vesicant. Ammoniac liniment consists of one part of solution of ammonia to three parts of olive oil. Ammonia is used as an antidote in cases of poisoning by prussic acid, tobacco, and other sedative drugs. Substitution ammonias are formed by the replacement of H by an alcohol radical forming Amines (q. v.), and by acid radicals forming Amides (q. v.). There are also ammonia substitution compounds of cobalt, copper, mercury, and platinum. (See *Watts' Dict. Chem.*)

ām-mō-nī-a-cŭm, s. [In Fr. *ammoniacum*; Ital. *armoniac*.] A gum resin, called also gum-ammoniac, which is imported into this country from Turkey and the East Indies in little lumps, or tears, of a strong and not very pleasing smell and a nauseous taste, followed by bitterness in the mouth. It is a stimulant, a deobstruent, an expectorant, an antispasmodic, a discutient, and a resolvent. Hence it is internally employed in asthma and chronic catarrh, visceral obstructions, and obstinate colic, while it is used externally in scirrhus tumors and white swellings of the joints. The plant from which it comes has not yet been thoroughly settled. That of Persia has been said to come from the *Dorema Ammoniacum*, but is more probably derived from the *Ferula orientalis*. (*Lindley: Veg. Kingd.*) Garrod believes it to be from the first-named of these two plants, which grows in Persia and the Punjab. Both are Umbelliferae.

Ām-mō-nī-an (1), †Ām-ō-nī-an, adj. [From Gr. *Ammon* and *Amōn*. Plutarch says that *Amōn* was the earlier and more correct form. Heb. *Amōn*, Jer. xlv. 25. On the Egyptian monuments *Amn*.] Pertaining to Jupiter Ammon, or to his celebrated temple in the oasis of Siwah in Libya. [AMMONITE.]

Ām-mō-nī-an (2), a. [From the philosopher mentioned in the def.] Relating to Ammonius Saccas, who set up a school at Alexandria in the latter part of the second century, and founded the Neo-Platonic philosophy. He maintained that all religions taught essentially the same truths, and required only to be rightly interpreted completely to harmonize. To produce the wished-for agreement he allegorized away whatever was distinctive in the several systems. Origen adopted his views.

Ām-mōn-ite, s. [Eng. *Ammon*; -ite. In Ger. *ammonit*; Greek *Ammon*, either an Egyptian word, or from the Gr. *ammos*=sand, and suffix -ite. "Ammon-stone." Jupiter Ammon had a celebrated temple in an oasis of the Libyan desert, and was worshiped there under the form of a ram, the horns of which the fossil Ammonites were thought to resemble. Hence the genus was called by the older naturalists *Cornu Ammonis*, a designation altered by Bruguière into *Ammonite*.] A large genus of fossil chambered shells, belonging to the class Cephalopoda, the order Tetrabranchiata, and the family Ammonitidae. The shell is discoidal, the inner whorls more or less concealed, the septa undulated, the sutures lobed and foliated, and the siphuncle dorsal. Before geology became a science, even scientific men, and much more the unscientific, were puzzled what to call these fossils. They were looked on as real ram's horns, or as the curled tails of some animals, or as petrified snakes, or as convoluted marine worms or insects, or as vertebræ. The petrified snake hypothesis being a popular one, some dealers fraudulently appended heads to make the resemblance more complete. It is to ammonites that Sir W. Scott refers when he says that—

"... of thousand snakes, each one
Was changed into a coil of stone
When holy Hilda prayed."

Marmion, ii. 13.

The ancients venerated them, as the Hindoos still do. About 700 so-called species have been described, ranging from the Trias to the Chalk. Several attempts have been made to divide the genus into sub-genera or sections; or if Ammonites be looked upon as a sub-family, then they will be elevated into genera. The following is the scheme adopted in Tate & Blake's *Yorkshire Lias*, pp. 267, &c.:

ām-mō-nī-ūm, s. [In Ger., &c., *ammonium*.]

Chem.: The name given by Berzelius to a supposed monatomic radical (NH₄). It is doubtful whether the ammonia salts—as chloride of ammonium, NH₄Cl—contain this radical, that is, whether N is sometimes a pentatomic element, or the molecule of NH₃ is united with the acid, as HCl, by molecular attraction—thus, NH₃.HCl—in the same manner as water of crystallization is united in certain crystalline salts. At high temperatures this salt is decomposed into NH₃ and HCl. The so-called amalgam of mercury and ammonium decomposes rapidly into hydrogen ammonia and mercury. It is formed by placing sodium amalgam in a saturated solution of NH₃.HCl. It forms a light, bulky, metallic mass. A dark-blue liquid, said to be (NH₄)₂ (ammonium), has been formed at low temperature and high pressure. But many of the salts of ammonium are isomorphous with those of potassium and sodium. The salts of ammonium give off NH₃ when heated with caustic lime or caustic alkali. With platinic chloride they give a yellow precipitate of double platinic ammonium chloride; also with tartaric acid a nearly insoluble white crystalline precipitate of acid tartrate of ammonia. The salts of ammonium leave no residue when heated to redness.

Anat.: A form of articulation in which two plane or mutually adapted surfaces are held together by a cartilaginous or fibro-cartilaginous lamina of considerable thickness, as well as by external ligaments.

¶ It is considered a variety of the synarthrodal joint. In man it occurs in the articulations between the several vertebrae, in that between the two ossa pubis, and that between the ilium and the sacrum.

ām-phīb'-ī-a, *s. pl.* [Neut. pl. of *amphibios*=living a double life, *i. e.*, both on land and water; Gr. *amphī*=double, and *bios*=life.] [AMPHIBIUM.]

Zoology: Animals which can live indiscriminately on land or water, or which at one part of their existence live in water and at another on land. It is used—

1. By Linnæus for the third of his six classes of animals. He includes under it reptiles in the wide sense of the word, with such fishes as are most closely akin to them. He divides the class into three orders, Reptiles, Serpentes, and Nantes.

2. By Cuvier, in his *Règne Animal*, for his third tribe of Carnivorous Mammalia, the first and second being the Plantigrades and Digitigrades. He included under it the Seals and their allies. In his *Tableau Élémentaire*, the arrangement is different, the Amphibia being an order ranked with the Cetacea (Whales), under his third grand division, Mammalia, which have extremities adapted for swimming, the first being "Mammalia which have claws or nails," and the second "those which have hoofs."

3. By Macleay, Swainson, Huxley, and other modern zoologists, the fourth great class of animals corresponding to Cuvier's reptilian order Batrachia. It is intermediate between Reptilia and Pisces. They have no amnion. Their visceral arches during a longer or shorter period develop filaments exercising a respiratory function, or branchiæ. The skull articulates with the spinal column by two condyles, and the base occipital remains unossified. But Huxley divides them into four orders, the Urodela, the Batrachia, the Gymnophiona, and the Labyrinthodonta. The frog, the toad, and the newt are familiar examples of the Amphibia.

ăm-phī-bōl'-i-a, ăm-phīb'-ōl-ỹ, s. [Lat. *amphibolia*, fr. Gr. *amphibolia*=(1) the state of being attacked on both sides; (2) ambiguity. From Greek *amphibolos*=(1) put round as a garment; (2) attacked from both sides; (3) ambiguous: *amphiballō*=to put round, to surround, to double; *amphī*, and *ballō*=to throw.]

A. Chiefly in the form Amphibolia:

Logic: What logicians have described as the *fallacia amphiboliae*. It occurs when a sentence, though consisting of words each of which, taken singly, is unambiguous in its meaning, is yet itself susceptible of a double signification, on account of the order in which the words are arranged, or for some similar reason. The Latin language was particularly liable to afford examples of amphibology—a fact well known to those who gave forth the “prophetic” utterances of the ancient oracles, as in the famous answer returned to Pyrrhus when he asked counsel as to whether he would be successful if he invaded the Roman empire, “Aio te, Æacida, Romanos vincere posse” (“I say that you, O son of Æacus, can conquer the Romans;” or “I say that the Romans can conquer you, O son of Æacus”). Similarly, the witch “prophecy” in English, “The Duke yet lives that Henry shall depose,” may mean “The Duke yet lives who shall depose Henry,” or “whom Henry shall depose;” but it may be said that the word *that* is ambiguous, and that consequently the sentence is an example not of amphiboly, but of equivocation. (See *Whately's Logic*, 9th ed., 1848, bk. iii., § 204.)

B. In the form Amphiboly:

Ordinary Language: In the same sense as that given under *A.*, *Logic*.

“Come, leave your schemes,
And fine amphibolies.”

Ben. Jonson: *Magn. Lady*, ii. 5.

“If it oracle contrary to our interest or humor, we will create an *amphiboly*, a double meaning where there is none.”—*Whitlock: Manners of the Eng.*, p. 254.

“Making difference of the quality of the offense may (say they) give just ground to the accused party either to conceal the truth, or to answer with such *amphibolies* and equivocations as may serve to his own preservation.”—*Bp. Hall: Cases of Conscience*.

ăm-phī-bōl'-ic, a. [Fæg., &c., *amphibole*; -ic.] Pertaining to *amphibole*, containing *amphibole*; consisting to a greater or less extent of *amphibole*.

1. Another name for Hornblende-rock (q. v.). (*Dana*.)

ăm-phīb'-ō-lōg'-i-cal-ly, adv. [Eng. *amphibological*; -ly.] In such manner as to involve an *amphibolia*; with ambiguity of meaning.

ăm-phīb'-ōl'-ō-gỹ, *ăm-phīb'-ōl'-ō-gie, s. [In Fr. *amphibologie*; Sp. and Ital. *amfibologia*; Port. and Lat. *amphibologia*; Gr. *amphibolos*=(1) put round as a garment, (2) attacked from both sides, (3) ambiguous; *logos*=word, discourse.] The same as *AMPHIBOLIA* (q. v.).

“For goddis speke in *amphibologies*,
And for one sothe they tellin twenty lies.”

Chaucer: *Troilus and Cresseide*, iv. 1,406-7.

“Now the fallacies whereby men deceive others, and are deceived themselves, the ancients have divided into verbal and real; of the verbal, and such as conclude from mistakes of the word, there are but two worthy our notation; the fallacy of equivocation and *amphibology*.”—*Browne: Vulgar Errors*.

ăm-phīb'-ōl'-ōid, a. [Eng. *amphibole*, and Gr. *eidōs*=appearance.] Having the appearance of *amphibole*.

“Never was there such an *amphibolous* quarrel; both parties declaring themselves for the king, and making use of his name in all their remonstrances to justify their actions.”—*Howell*.

2. **Of words:** Susceptible of a double construction, though the meaning of each word, taken singly, is apparent.

“An *amphibolous* sentence is one that is capable of two meanings, not from the double sense of any of the words, but from its admitting of a double construction.”—*Whately: Logic*, 9th ed. (1848), bk. iii., § 10.

ăm-phīc'-tỹ-ōng, s. pl. [According to the Greeks, from an ancient hero, Amphictyon, said to have founded the most celebrated of the Amphictyonic associations; but he seems to have been a myth invented and named in order to explain the existence of the association. Doubtless from Gr. *amphiktiones*=they that dwell near, next neighbors; *amphī*=round about; and *ktizō*=to people a country.] Delegates from twelve of the states of ancient Greece which entered into a league to protect the temple of Apollo at Delphi, and to promote peace among the confederate states. The conception was a noble one, but, like the Holy Alliance in modern times, the performance was of a different character. The Amphictyonic League were chiefly responsible for two cruelly-conducted wars, and on the whole exerted an evil rather than a beneficial influence. Besides the association which attained such celebrity, and which met in the spring at Delphi, and in the autumn at a temple of Demeter, within the pass of Thermopylæ, there were other ancient Amphictyonies of lesser celebrity.

1. As the name implies, a double theater. The ancient theaters were nearly semi-circular in shape; or, more accurately, they were half ovals, so that an amphitheater, theoretically consisting of two theaters, placed with their concavities meeting each other, was, loosely speaking, a nearly circular, or, more precisely, an oval building. Amphitheaters were first constructed of wood, but in the time of

sand or sawdust. The part next the arena was called *podium*, and was assigned to the emperor, the senators, and the ambassadors of foreign nations. It was separated from the arena by an iron railing and by a canal. Behind it rose tiers of seats, the first fourteen, which were cushioned, being occupied by the equites, and the rest, which were of bare stone, being given over to the common people. Except when it rained, or was exceedingly hot, the amphitheater was uncovered. Among the sights were combats of wild beasts and gladiator fights. The Romans built amphitheaters wherever they went. Remains of them are still to be found in

Plan of the Coliseum.

1. Section of ground plan. 2. Section of first floor. 3. Section of second floor. 4. Section of highest gallery. various parts of Europe; but the most splendid ruins existing are those of the Coliseum at Rome, which was said to have held 87,000 people.
